## **ABSTRACT**

### **INVESTIGATING THE FUNCTIONS OF COPPER MATERIAL CULTURE FROM FOUR ONEOTA SITES IN THE LAKE KOSHKONONG LOCALITY OF WISCONSIN**

by

Jacqueline Marie Pozza

The University of Wisconsin-Milwaukee, 2016  
Under the Supervision of Professor Robert J. Jeske

This thesis explores Oneota use of native copper in the Lake Koshkonong locality between A.D. 1100 and 1400. Over 600 pieces of Oneota copper artifacts originating from four sites were documented and analyzed in order to investigate distribution, production, utilization, and the ideological and social significance behind this raw material. The artifacts analyzed for this study were recovered from Oneota sites adjacent to Lake Koshkonong in Jefferson County, Wisconsin: Crabapple Point (47JE93), Schmeling (47JE833), Koshkonong Creek Village (47JE379), and Crescent Bay Hunt Club (47JE904). These assemblages primarily included awls, beads, pendants, and fragmented material. The data set also includes unique items, such as adzes and a copper mace.

Data collected through this project supported multiple conclusions surrounding Lake Koshkonong Oneota copper use. Manufacturing marks on beads provide arguments for multiple manufacturing traditions in the area. The use-wear observed on awls both support and question previous assumptions of their use. Additionally, the distribution of these artifacts among the sites and the iconographic symbols present among the collections suggest larger ideological and social significance of copper within Oneota groups. It also appears that the Lake Koshkonong locality has a prolonged tradition of metalworking that extends from Archaic to Historic period, implying

a cultural association with metal production and the physical setting of these sites. Overall, these conclusions suggest that the Oneota viewed copper as a prestige good. These valued items both established and reaffirmed social order and legitimized the ideological, economic, military, and political power of certain individuals or kin groups living along the northwest shores of Lake Koshkonong at this time.

## ACKNOWLEDGEMENTS

This thesis would not have been possible without the help and support of numerous individuals. First, I would like to personally extend my gratitude to my advisor, Dr. Robert Jeske, and committee members, Drs. John Richards and R. Jason Sherman, for their guidance, feedback, and encouragement. I would also like to acknowledge the generosity of Mr. Jim Bussey and Mr. Kevin Schmeling for the use of their private collections. Thank you to Rick Edwards and Rachel McTavish for being incredible resources and for providing numerous references and continued optimism. Also, thanks to Rob Ahlrichs who helped facilitate and brainstorm aspects of this project, and to Robert “Ernie” Boszhardt and Danielle Benden for their guidance. Additionally, I would like to sincerely thank two of my mentors, Dawn Scher Thomae and Dr. W. Warner Wood.

I would also like to acknowledge my family and friends for their unwavering love. My deepest gratitude to my parents, Tom and Karen, and to my siblings, Lauren and Nick, for the constant encouragement and support. A thousand thanks to Allyse Freeman and Barbara McClendon for being my graduate school guardian angels. Also, I must thank Victoria Pagel for being an invaluable sounding board, as well as Janelle Safian, Theresa Heindel, Jennifer Christianson (Lindahl), and Nicole Alexander (Duhr). Lastly, I would like to extend my gratitude to everyone else who has helped me along the way and are too numerous to name individually, but include Zelda, Iron Maiden, and fearless feminists who paved the way before me.

## CHAPTER 1: INTRODUCTION

Prehistoric copper artifacts from the Midwest United States have fascinated archaeologists for roughly 175 years, but the roles and definitive uses of these objects in the societies of ancient peoples have still not been fully realized. While much research has been conducted on these objects, numerous factors have hindered more rigorous examinations of copper material culture from the Midwest including rampant private collecting, especially by metal detectorists; small copper assemblages from professional excavations; delayed advances and applications of technological and chemical analyses due to a lack of funding and technological literacy; and dedication of research efforts to more prevalent material culture with established methodology, such as lithics and ceramics. The continuity of copper usage in prehistoric groups of the Midwest speaks to its significance in the economies, social interactions, and ideologies of these peoples. With such an extensive history of copper exploitation throughout prehistory and a dense accumulation of literature about the prehistoric presence of this material, expanding the understanding of Oneota copper usage specifically and its broader role in the social relations of these groups is a valuable contribution to this body of research.

### *The Project*

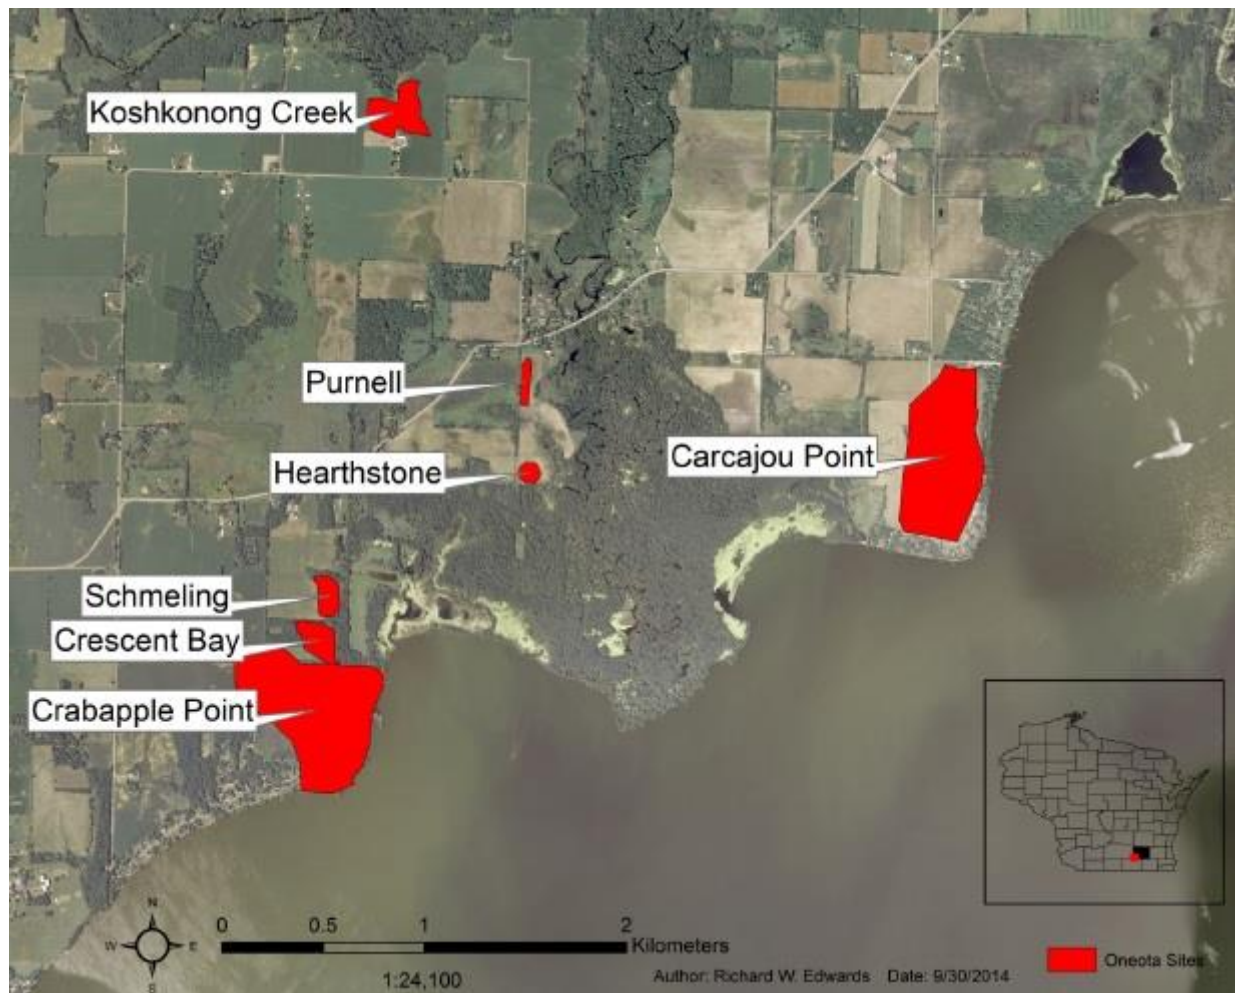

The focus of this thesis is to identify the ways in which Oneota groups living in the Lake Koshkonong locality of Wisconsin from A.D. 1100 to 1400 utilized copper. Underlying this goal are four central questions:

1. What manufacturing techniques were used to create these copper artifacts? Can manufacturing traditions be ascertained among/between the sites?

2. What type of use-wear is present in each artifact category? Does this confirm or call into question the previous assumptions of their use?
3. Are the artifact types equally present at each site? What might this imply about the social relationships between these sites?
4. What types of ideological symbols are present among the pendants? What might these suggest about Oneota ideology and the ideological function of these items?

In order to answer these questions, an analysis of copper collections originating from four Oneota occupations situated in close proximity to one another on the northwest side of Lake Koshkonong was conducted. Data sets represent copper material culture from Crescent Bay Hunt Club site (47JE904, CBHC), the Koshkonong Creek Village site (47JE379, KCV), the Schmeling site (47JE833), and Crabapple Point (47JE93, CAP) (Figure 1). Copper from the first two sites were recovered during University of Wisconsin-Milwaukee field schools, whereas the latter two are part of the private collections of Mr. Kevin Schmeling and Mr. Jim Bussey, respectively. Overall, the 636 pieces of the study assemblages include copper awls, beads, tinkler cones, pendants, and fragments.

University of Wisconsin-Milwaukee (UWM) archaeologists have conducted systematic research at a series of sites at Lake Koshkonong for nearly two decades, and have produced numerous dissertations, theses, and articles on that research (e.g., Edwards 2010; Foley Winkler 2004, 2011; Hunter 2002a, 2002b; Jeske et al. 2002, 2003; Jeske and Winkler 2008; Moss 2010; Olsen 2003; Picard 2013; Winkler 2011; Winkler and Jeske 2009). However, this detailed literature lacks thorough investigations of the role of copper in Oneota society, ideology, and economy. This thesis aims to add another dimension to the knowledge of Oneota material culture of the Lake Koshkonong Phase by observing the form and function of copper artifacts of these

**Figure 1. Oneota sites near Lake Koshkonong in Jefferson County, Wisconsin (Edwards 2014).**

four sites, which will allow for a broader discussion of copper use among Oneota groups.

Artifact morphology and indications of use and manufacture were thoroughly documented in order to gather a deeper understanding of the Oneota uses of this raw material. Data from these observations not only illuminate the multiple functions of these materials, but also indicate possible exchange networks and social relations occurring both within and between the sites and with other groups outside of the Lake Koshkonong area. By observing the form of these artifacts and their manufacturing and use-wear, this thesis aims to spark a broader discussion about the roles of copper in the economy, ideology, and social organization of Oneota groups.

## ***Research Design and Expectations***

To collect the data needed to answer the proposed questions of this project, artifacts were cataloged, described, and measured. A detailed description of the methods used to collect this information is provided in the Methods chapter of this thesis.

Some hypotheses were drawn from the preliminary observations of the copper collections. It was expected that multiple manufacturing techniques were employed to create the artifacts at these sites. Even though the collections all originate from Oneota contexts, the current lack of evidence for craft specialization in Oneota economies suggests that the various households and/or kin groups producing these goods may have had individual manufacturing traditions, especially across multiple sites (Benn 1989; O’Gorman 1996). By observing the form and manufacturing wear on these artifacts, it was expected that manufacturing traditions implemented by Oneota groups would be possible to discern.

In addition to physical evidence of manufacture, observations of use-wear aided understanding of the technical functions of these artifacts. Use-wear studies of metallic artifacts are less common than those of stone and bone tools. This lack is due to “fears that the recycling, manipulation, re-sharpening and corrosion of metal would seriously limit the potential of such studies” (Roberts and Ottaway 2003:119-120; see also Dolfini 2011; Dolfini and Crellin 2016; Penman 1977; Sievert Hohol 1984a, 1984b). However, over two decades of use-wear analyses on bronze and copper objects have shown that macroscopic use-wear observations have research potential and should be documented (Dolfini 2011; Dolfini and Crellin 2016; Kienlin and Ottaway 1998; Moyler 2007; Sievert Hohol 1984a, 1984b). It was expected that the use-wear observed on these objects would support or question the technical uses previously ascribed to various artifact types.

The distribution of the artifacts among and within the sites were also expected to provide insight as to how these objects were traded and their social functions. The variation in recovery methods and duration of investigations between the sites skew the data required to reliably compare artifact densities between the sites. While Mr. Bussey's collection composes the overwhelming majority of specimens in this study, he has been collecting copper artifacts from CAP using a metal detector for over half a century. Conversely, only a few scientific excavations have been completed at KCV and Schmeling. CBHC has had more extensive testing and archaeological excavation, which allows for somewhat reliable comparisons with the Bussey collection; however, nearly 90% of the site is remains to be investigated. Although the owners of CBHC and Schmeling sites do not allow metal detector use on their property for copper collecting, other metal detector users may have surreptitiously worked over these sites (Kevin Schmeling, personal communication). Mr. Bussey's collection is very well known in the detector community, and it is highly likely that others may have surveyed the sites over the years. Keeping these potential problems in mind, it was still possible to observe the difference in artifact densities among the four sites. It appears that each site has a variety of artifact types present. Even with collecting techniques considered, the abundance of copper from Bussey's collection indicates that this area was a hub for copper production, trade, and use.

Lastly, the number of symbols represented by the pendants in the collections and the presence of a copper mace indicates the ideological significance of native copper. While it may be difficult to confidently interpret these symbols, archaeologists have proposed a number of hypotheses (Benn 1989; Berres 2001; Ehrhardt 2009; Hall 1962; Lillie and Schermer 2015; Trevelyan 2004). This project does not aim to determine the precise meanings behind the

symbols present among the Koshkonong collections, but attempts to understand their possible social roles and ideological significance.

### ***Significance and Contributions***

A comprehensive investigation of copper artifact functions adds to the body of research on the Lake Koshkonong Oneota and copper studies in general. In past analyses of copper artifacts, it is often the case that some artifacts were placed in functional categories without testing the probability of these proposed functions. For example, Wittry's (1950) typology is often referenced in copper studies (e.g. Martin 1999; Parkinson 2003). However, Wittry assumed that form implied function and assigned artifacts to types such as drill, celt, and knife without demonstrating this function beyond the object's form. Currently, artifacts that have been classified as awls, for example, are commonly dubbed as such without unequivocal empirical evidence to support this functional categorization. Also problematic is that these categories often restrict artifacts to one technical function and ignores other equally significant uses. Though the majority of archaeologists agree that all copper objects had technical, social, and ideological functions (see Binford 1962); analyses of copper artifacts, especially in site reports, often do not include discussions of their social and ideological uses (e.g. Cleland 1971; Kelly 1991; Overstreet 1981; Parkinson 2003; Penman 1977; Wittry 1950). By observing the instances of use-wear on objects in the collection, it is possible to obtain more empirical data on the actual function of these objects.

Evaluating the methods chosen for this research will also be a beneficial contribution. Though it has been sporadically implemented in analyses of European prehistoric artifacts, use-wear analysis of North American copper artifacts is an underutilized method. While a full-scale

use-wear analysis study is beyond the scope of this project, understanding the research potential of documenting signs of manufacture and use will be a valuable contribution to the field and provide comparative data for future studies.

By including archaeological artifacts with limited provenience information, this project also aims to illustrate to the archaeological community that collections with approximate provenience and/or provenance can still be utilized in archaeological research. The restricted access of the private collections in this study increases the value of their thorough documentation as well. Data collected through this research along with its analysis will be made accessible in open access outlets so that the public and other researchers can freely access it for additional research and other educational purposes.

### ***Thesis Organization***

Following this introductory chapter, this thesis has five chapters. Chapter 2 consists of a literature review in which relevant research on the Oneota, the Lake Koshkonong sites, and prehistoric copper artifacts of the Midwestern United States are discussed. A detailed explanation of this project's methods is delineated in Chapter 3. The results of data collection are reviewed in Chapter 4, and conclusions are drawn from this data in Chapter 5 where answers to the four research questions are addressed. Finally, Chapter 6 discusses the overall goal of this research project and identifies how Lake Koshkonong Oneota groups used copper when they resided among the four sites in this study. Additionally, the appendices of this thesis include the documentation form template and recording schema used in this study. The recovered information and photographs for each copper object are also included in the appendices. This information is organized by artifact type then by catalog number.

## CHAPTER 2: BACKGROUND

### *Cultural Background and Landscape*

#### The Oneota

Originally named by Keyes (1927) and later emphasized by McKern (1945) in his categorization of Midwest archaeological material, the archaeological term Oneota does not refer to a singular ethnographic group. Rather, it is a classification ascribed to a specific type of material culture, especially assemblages including globular, shell-tempered ceramics and triangular bifaces (Edwards 2010; McKern 1945; O’Gorman 1996; Overstreet 1997). This term has also been mistakenly used to describe the people occupying the archaeological sites that yield this signature material culture and technology at congruent spatial and temporal parameters; a practice that scholars have addressed and now actively avoid (Benn 1995; Edwards 2010; Jeske and Hunter 2001; O’Gorman 1996; Overstreet 1997; Staeck 1995). While Oneota can only technically be used to describe the material culture fitting this style, it is important to recognize that individuals created and used these artifacts: the artifacts themselves do not have agency (Benn 1995). Similarly, Wobst (1977) warns that archaeologists and ethnographers have had the tendency to equate an individual’s behaviors or products of behaviors (artifacts) into a standard for an entire ethnicity, which is often then bound by geographic regions without considering broader social interactions. Oneota researchers have combated this tendency by recognizing regional variation, considering gender and agency, and investigating numerous levels of social interaction (e.g. Benn 1995; Foley Winkler 2011; Gibbon 1995; Jeske 1998; Schneider 2015). The identity of the individuals responsible for Oneota material remains and the utility of this classification is still debated in the academic community, and is exacerbated by the fact that “[t]he formal content of this manifestation exhibits considerable consistency across

broad space and time but also possesses an uncomfortable variability, at least on its temporal and spatial peripheries, that blurs precise taxonomic definition” (Hollinger and Benn 1998:1).

Additional research has revealed that Hollinger and Benn’s (1998) observation on variability was an understatement, and that the geographic and chronological variation in Oneota material culture makes it clear that this was not a homogenous ethnic or cultural group.

As visible in the archaeological record, Oneota groups inhabited much of the Midwest, including portions of Wisconsin, Minnesota, Iowa, Illinois, Indiana, Michigan, Missouri, and extending into South Dakota, Nebraska, and Kansas (Benn 1989; Jeske and Hunter 2001; Overstreet 1997). Radiocarbon dates of material excavated from Oneota sites have revealed that these groups occupied the region from around A.D. 1000 to 1600, although some calibrated dates have extended beyond the limits of this span (Boszhardt et al. 1995; Jeske and Hunter 2001; Overstreet 1997; Richards et al. 1998; Schneider et al. 2012). The chronology for Eastern Wisconsin is much more limited, with radiocarbon data indicating a range of A.D. 1050 to 1400 (Schneider 2015).

Oneota is lumped together with other contemporaneous groups; such as the Langford, Fisher, and Fort Ancient traditions; under the umbrella term *Upper Mississippian*. Groups deemed Upper Mississippian characteristically lived around the upper Mississippi River Valley area and produced globular, shell-tempered ceramics and small, triangular projectile points (Griffin 1946; McKern 1945). This broad classification acknowledges the cultural variation between these groups, but also denotes their similarities and possible interactions (Edwards 2010; Wilson 2016). The utility of this term also allows for differentiation between Upper Mississippian groups and those deemed *Middle Mississippian*, which includes groups residing further south in the Mississippi River Valley whose societies had more defined social

stratification, as seen at the monumental Middle Mississippian site of Cahokia (Edwards 2010). Berres (2001:6) differentiates Oneota groups from Mississippi societies “by their successful adaptation to the biogeographical region exhibiting a mosaic of grassland, forest, and aquatic/wetland resources.”

### Regional Traditions

Since the Oneota cultural designation appears across an expansive region, archaeologists have recognized smaller, regional variants that have unique histories and material culture. In Wisconsin alone, archaeologists have generally accepted the following regional localities: La Crosse, Red Wing, and Sheffield, which are at the western edge of the state along the Mississippi River; Grand River, centered in present-day Marquette and Green Lake Counties; Middle Fox River Passageway west of Lake Winnebago; Waupaca, which stretches across both Waupaca and Portage Counties; Wolf River presiding in Langlade, Oconto, Menominee, and Shawano Counties; and, the focus of this thesis project, Lake Koshkonong, which is on the northwest shore of the lake for which it is named (Hall 1962; Hollinger and Benn 1998; Jeske et al. 2016; Overstreet 1997; Schneider 2015; Wilson 2016). These localities appear to be autonomous regional groups who occasionally interacted with one another and shared some cultural and technological aspects while maintaining unique individual identities (Jeske et al. 2016; Schneider 2015).

### Oneota Origins

The nature of the origin of Oneota and the date of its occurrence have both been contested in the archaeological community. While Overstreet (1995) argued for an early tenth

century date, Theler and Boszhardt (2006) asserted that the emergence of Oneota material culture occurred around A.D. 1150 after Late Woodland groups adapted to resource shortages and increasingly interacted with Middle Mississippians. However, improved dating methods and newly recovered radiocarbon dates from Oneota and Langford sites in eastern Wisconsin and northern Illinois point to an eleventh-century emergence, which is prior to significant Middle Mississippian encounters (cf. Jeske 2000; Overstreet 1997). Although Theler and Boszhardt (2006) take issue with Overstreet's (1997) earliest dates, three recently excavated Oneota sites at Lake Koshkonong – CBHC, KCV, and Carcajou Point – yield well-provenienced dates with two sigma values that extend from A.D. 1000 to 1100 (Jeske 2002; Jeske et al. 2016; Richards et al. 1998).

Adding to early confusion, Overstreet (1997:260) suggested that there was a lack of Oneota occupations in eastern Wisconsin from A.D. 1050 to 1150, which he attributed to the “presence of Middle Mississippian-supported Late Woodland populations” and possible issues with radiocarbon dates around this time (see also Goldstein 1991; Richards 1992). However, additional radiocarbon dates recently recovered from the Lake Koshkonong area have shed light on this issue. These dates show that Oneota groups occupied Lake Koshkonong during the proposed “Aztalan Gap” (Jeske et al. 2003:93; Jeske et al. 2016; Richards and Jeske 2002:43-46) (Figure 2). The nature of the relationship of Middle Mississippian occupants of Aztalan with Oneota groups of Wisconsin is unclear at this time and beyond the scope of this thesis to address.

Numerous archaeologists have also debated the manner in which the Oneota emerged. Griffin (1960) first postulated that Oneota culture emerged when a migration of groups from Cahokia moved north, however the advent of radiocarbon dating left this theory in disfavor (Edwards 2010; Overstreet 1997). At present, the exact geographic origins of the culture are

**Figure 2. Radiocarbon dates from Lake Koshkonong Oneota sites (Jeske et al. 2016).**

unknown and two major theories of how those bearing this material culture emerged in Wisconsin are prominent in the literature (Benn 1995; Edwards 2010; Hall 1962; O’Gorman 1996; Overstreet 1995; Theler and Boszhardt 2006). One theory argues that the Oneota developed *in situ* from the Late Woodland groups as a result of environmental factors, interactions with Mississippian groups, or a shift in subsistence strategies (Benn 1995; Edwards 2010; Gibbon 1982; Hall 1962; Jeske 1992; O’Gorman 1996; Schneider 2015; Stoltman 1986; Theler and Boszhardt 2006; Wilson 2016). A second theory asserts that the Oneota migrated north from northeastern Illinois and displaced Late Woodland groups in Wisconsin and other parts of the upper Midwest (McKern 1942; Overstreet 1995). However, an amalgamation of these theories is probably the most realistic explanation for the appearance of Oneota material culture in prehistoric Wisconsin (Edwards 2010; Overstreet 1997; Wilson 2016).

### Oneota Culture History

Previously, Oneota archaeologists have utilized a quadripartite horizon sequence for the sites and material culture of these groups that included Emergent (A.D. 950-1150), Developmental (A.D. 1150-1350), Classic (A.D. 1350-1650), and Historic (after A.D. 1650) Horizon (Hall 1962; Overstreet 1997). Recent research indicates that variation in the criteria and dates for these horizon divisions is significant enough that the horizon concept in Wisconsin is no longer tenable (Edwards, 2010; Jeske and Sterner Miller 2015; Schneider 2015). This contemporary research identifies a shift in Oneota lifeways that occurs at approximately A.D. 1400, which results in diverse material culture and subsistence strategies between the Early Oneota (A.D. 1100 to 1400) and Late Oneota (A.D. 1400 to 1650) (Jeske et al. 2016; Schneider 2015).

The most significant variation in material culture between Early and Late Oneota groups is the variation in ceramic decoration. Early Oneota assemblages include mostly undecorated, shell-tempered ceramics (Edwards 2010; Overstreet 1997; Schneider 2015). Decorations that appear on a small number of vessels include lip modifications, as well as curvilinear or rectangular trailed designs (Edwards 2010; Overstreet 1997; Schneider 2015). Pinch pots are also common among these early assemblages (Overstreet 1997). After A.D. 1400, Oneota ceramic decorations become more elaborate. Undecorated ceramics are rare, and trailed or incised designs frequently appear on the shoulders of vessels, often accompanied by punctates (Overstreet 1997; Schneider 2015).

The Oneota lithic tool kit includes small, triangular projectile points, end scrapers, and knives (Edwards 2010; Overstreet 1997). Hall (1962) argued for a shift in the ratio of triangular projectile points to end scrapers across time, with a higher proportion of projectile points in earlier assemblages (Edwards 2010; Overstreet 1997; Schneider 2015). While this theory may hold true with tools specifically classified as end scrapers, Sterner (2012) has argued through use-wear analysis that edge-utilized lithic pieces were used in a scraping function. This new information distorts the ratio of projectile points to scrapers, and could indicate more consistent tool kit functions across time. In addition to chipped stone, catlinite pipes also appear in Oneota assemblages around A.D. 1350 (Schneider 2015).

While numerous Oneota sites across the Midwest yield scapula hoes, this tool type has not been recovered from the Lake Koshkonong sites (Jeske et al. 2016). Instead, digging sticks have been found; a tool common to Langford groups who worked upland soils that were relatively dry, which suggests the Lake Koshkonong Locality had similar soil drainage (Edwards 2010; Jeske 1989; Jeske et al. 2016). Bone awls are common throughout Early and Late Oneota

periods, and other faunal tools and ornaments, become more frequent throughout time (Jeske et al. 2016; Overstreet 1997; Schneider 2015).

Architecture among Oneota sites includes a variety of house styles and some defensive structures. Wigwams have been found among Early Oneota occupations at Carcajou Point, and small rectangular semi-subterranean houses have been found both at Carcajou Point and Old Spring (Hall 1962; Hollinger 1995; Overstreet 1997). Some fortifications, such as palisades, have also been found at Early and Late Oneota sites (Overstreet 1997). Late Oneota sites that extend into historic times include large, multi-family longhouses (Edwards 2010; O’Gorman 1996; Overstreet 1997). In some regions, this shift in domestic structures has been related to a shift from matrilineal to patrilineal practices (Hollinger 1995; O’Gorman 1996). However, the Lake Koshkonong sites have both wigwams and longhouses that appear to be contemporaneous, dating to approximately A.D. 1200 to 1400 (Schneider 2015).

Distinct shifts in material culture around A.D. 1400 point to significant changes in social climate and subsistence strategies around this time. Identifying the causes of this transition requires additional research, though some have attributed these changes to increased population density (Gibbon 1986; Jeske 1992; Overstreet 1997).

### Historical Ties

Similar to the origins of Oneota groups, their historical connections are also greatly debated by the archaeological community. Both archaeologists and living tribal members are invested in understanding the transitional period between prehistory and history. Efforts have been made to demonstrate Oneota connections to various historic tribes, such as the Ioway, Oto, Ho-Chunk, Winnebago, Missouri, Osage, and Kansa, but the issue of unknown prehistoric

migrations muddles our understanding of what exactly happened to the Oneota in the seventeenth century (Benn 1995; Birmingham 2014; Hall 1962, 1995; Hollinger 1995). It is currently unknown if the Oneota migrated out of the Midwest toward the Plains, were ravaged by diseases introduced to indigenous groups by European explorers and traders, intermarried and became culturally blended with other groups, are direct antecedents to historic tribes, or a mixture of these possibilities (Benn 1995; Edwards 2010; Hall 1995; Hollinger 1995; O’Gorman 1996; Overstreet 1997).

Unfortunately, neither the archaeological record nor historical documents provide any definitive answers. Few Oneota sites have yielded historic materials, and those in which European trade goods have been found provide inconclusive evidence (Birmingham 2011; Edwards 2010; Overstreet 1997). Overstreet’s (1993, 1997) Dandy Phase of three Oneota sites may provide some answers, but Mason (1993) argues that Overstreet’s (1993) evidence does not demonstrate a clear connection between Oneota and Historic groups. Currently, there is not enough data to strongly support these ties.

Historical documents indicate that some Native groups “did not desire to commerce with the French” (Blair 1911-1912:293), which could also explain the lack of European trade goods in Oneota contexts (Overstreet 1997). Uncertainties about the specific geographic location of Jean Nicolet’s travels, one of the earliest European explorations in the region, and the identity of the indigenous people he met upon landing also complicate firm connections between Oneota and historic groups (Edwards 2010; Hall 1995; Richards 1993). Though there are some cultural and stylistic similarities between the Oneota and later historical groups, demonstrating solid ties between them will require additional research.

## Site Settings and Subsistence

Throughout the Midwest, Oneota groups exploited a range of foodstuffs. This resourcefulness was probably one factor in the longevity of their site occupations. Deer and fish were the most important protein sources and were accompanied by corn, beans, and squash, as well as freshwater mussels and wild rice (Edwards 2010; Hall 1962; Jeske et al. 2016; O’Gorman 1996; Overstreet 1997; Wilson 2016). The typical geographic location for Oneota settlements reflects this lifestyle since sites are commonly located by wetlands with adjacent areas for foraging and agriculture (Edwards 2010; Foley Winkler 2011; O’Gorman 1996; Rodell 1983; Wilson 2016). The presence of ridged fields, larger storage pits, and numerous bison scapula hoes at western Oneota sites point to the importance of agriculture in their subsistence strategy (Theler and Boszhardt 2006).

Sites vary in composition and length of occupation. While more permanent settlements could be described as “small hamlets” (Foley Winkler 2011:206) or larger “village farming communities” (Overstreet 1997:251), more temporary sites have been deemed “extractive sites” (O’Gorman 1996:54). Oneota sites are usually clustered with an expanse of land between each grouping, and are focused near a water source, arable land, and a wetland or marsh (Edwards 2010; Richards and Jeske 2002; Schneider 2015; Wilson 2016).

## Social Climate

Throughout their history, Oneota and other Upper Mississippian groups achieved increased surpluses of foodstuffs through more efficient subsistence strategies and intensified agriculture, which acted as a catalyst for a rise in population density, competition for resources, social inequality, and violence between cultural groups (Benn 1989, 1995; Brown 1982;

O’Gorman 1996; Strezewski 2006; Theler and Boszhardt 2006). This hostile social environment pressured groups to tribalize, or conglomerate into culturally-defined groups as a protective strategy (Benn 1989; Emerson 1999; Jeske 1998). Group identities of tribes were developed and maintained through art and ritual (Benn 1989). For the Oneota, this identity was defined with a unique artistic style and ritualized bundles (Benn 1989; Berres 2001; Schneider 2015). Some scholars (e.g. Benn 1989) have suggested that this environment would have allowed for social differentiation to emerge. Because of this developing social inequality, influential community members may have had the opportunity to control cultural and ritual symbols by publicly wearing or using them in an attempt to increase their coercive ability over other tribal members (Benn 1989). Additionally, it appears that Oneota and Langford groups were territorial (Emerson 1999; Foley Winkler 2011; Jeske 1989, 1990, 2000, 2003). This territoriality may point to the importance of landscape and place in the group identity of Oneota and Langford groups (c.f. Berres 2001; Foley Winkler 2011; Jeske 2003).

Archaeological and ethnographic data suggest that the Oneota were probably organized within clans and included some social differentiation (Benn 1989; Schneider 2015). Building on Radin’s (1970 [1923]) ethnographic research among Ho-Chunk groups, archaeologists such as Schneider (2015) have suggested that these clan groups probably had animal totems related to either the upper or lower worlds, and that these totems were accompanied with specific clan social roles and responsibilities. Based on mortuary evidence, eastern Wisconsin Oneota groups were egalitarian with some opportunities for achieved status of individuals or families (Foley Winkler 2011).

Previous research has shown that Oneota groups were not isolated from one another nor from other cultural groups (e.g. Gibbon 1995; Schneider 2015; Stoltman 1986; Strezewski 2006).

The presence of exotic trade goods and the evidence for increased violence and malnutrition in Oneota archaeological contexts are testimony to the complex social dynamics of the period (Benn 1989; Fogel 1963; Hill 2006, 2012; Martin 1999; Schneider 2015, Strezewski 2006). Similarly, scholars are beginning to realize the degree to which this violent social climate restricted resources available to Oneota groups (Emerson 1999; Jeske 1998; Milner et al. 1991; Schneider 2015; Strezewski 2006; Wilson 2016). Emerson (1999) claims that this warfare could have been a major catalyst for cultural change throughout Oneota history. Markers of violence are significantly prominent among the human remains at some sites, such as Norris Farm 36 where one-third of adults show evidence of violent deaths (Milner et al. 1991; Karsten 2015). The few burials at the Lake Koshkonong sites have exhibited blunt trauma, projectile and knife wounds, as well as evidence for substantial malnutrition (Jeske et al. 2016).

### ***The Lake Koshkonong Sites***

The four sites in the Lake Koshkonong area from which the artifacts of this project originate are the Crescent Bay Hunt Club site (CBHC), the Koshkonong Creek Village site (KCV), the Schmeling site, and the Crabapple Point site (CAP). These sites are clustered near the northwest shores of Lake Koshkonong or near Koshkonong Creek, a small creek that runs north and west of the lake (Figure 1). The area has been investigated by both professional archaeologists and local amateurs for over a century, and has a dense archaeological record showing both prehistoric and historic activities. The specific sites included in this study have been dated to ca A.D. 1050 to 1400 by series of well-provenienced radiocarbon dates (Edwards 2010; Jeske 2000, 2001; Jeske et al. 2016; Richards et al. 1998; Schneider 2015).

## Area Excavations and Previous Research

Since Stout and Skavlem (1906) first surveyed the archaeological sites in the area, there have been numerous investigations on the northwest shores of Lake Koshkonong where the four sites of this project are located. Stout and Skavlem's (1906) initial survey of the area identified a variety of habitation including campsites and villages. Almost forty years later, Charles E. Brown conducted another survey of the region while amassing archaeological data of Wisconsin and "noted several garden bed and burial sites in the region" (Schneider 2015:113).

In the 1950s, Robert Hall (1962) initiated research at Carcajou Point, which is just east of CBHC. Through ceramic analysis and observations of house structures present at the site, Hall (1962) concluded that Carcajou Point was occupied by people were influenced by Middle Mississippian cultures. Hall (1962) argued that the curvilinear designs on ceramics excavated from Carcajou Point and a lack of end scrapers in the lithic assemblage indicated an Early Oneota occupation (A.D. 1000 to 1400) that did not extend into the Late Oneota period (post A.D. 1400). Additionally, Hall (1962) collected a radiocarbon date of 1528 $\pm$ 250, and suggested that the Koshkonong Phase could conceivably extend later. However, recent dating by UWM excavations suggest that Carcajou Point dates to pre-A.D. 1400 (Richards et al. 1998). A UWM project led by Robert J. Jeske in 2002 also investigated Carcajou Point, which revealed a Paleoindian component at the site (Jeske and Hunter 2001; Winker 2011). These excavations also procured some archaeological copper: two Late Woodland awls and a Late Archaic spear point and awl (Hill and Jeske 2011).

In the 1970s, Janet Spector (1975) conducted research at CAP, located just south of CBHC and the Schmeling site. While there are prehistoric occupations at this site, Spector (1975) focused on eighteenth-century Ho-Chunk occupations. From her observations, Spector

(1975, 1977) suggested that CAP was a site of specialized activities, specifically those involving mining, processing, and manufacturing lead. Birmingham (2011, 2014) studied artifacts originating from CAP collected by Mr. Jim Bussey and noted a similar abundance of lead materials from this area, including French trade goods from the eighteenth century. In addition to the historic materials, Birmingham (2011) commented on the abundance of Oneota material that Mr. Bussey removed from the Oneota component of CAP located on top of a bluff above the adjacent historic component. Birmingham (2011) indicates that a small number of Mississippian wares were found among the assemblage, suggesting that this group was in contact with or related to Mississippian groups. Schneider and Jeske have reviewed that material and suggest that his identification of Mississippian wares is equivocal (Jeske, personal communication). Being immediate neighbors with CBHC and sharing almost identical material culture, it is highly likely that inhabitants of CAP were in close contact with those residing at CBHC (Birmingham 2011; Jeske et al. 2016). Though prehistoric and historic artifacts are found at the site, Spector (1975) notes that no features held both prehistoric and historic goods, and Birmingham (2011, 2014) indicates that no Historic ceramic types were found at the site.

David Baerreis began the first systematic investigations at CBHC when he led a group of University of Wisconsin-Madison students in excavating a small test area, finding a subterranean, rectangular posthole structure and pit features (Gibbon n.d.; Schneider 2015). UWM began field school excavations at CBHC in 1998 that continue to this day (Jeske et al. 2016). Field school students have also excavated at the nearby KCV and Schmeling sites, which are both contemporaneous with CBHC (Edwards 2010; Foley Winkler 2006). While the numerous theses, dissertations, and other publications resulting from these excavations provide a substantial body of research covering lithic and ceramic material culture (Carpiaux and Edwards

2014; Carpiaux 2015; Schneider 2015; Sterner 2012; Sterner-Miller 2015; Wilson 2016; Winkler 2004), faunal remains and mortuary practices (Foley Winkler 2004, 2011; Van de Pas et al. 2015), agricultural practices (Olsen 2003); and settlement and catchment patterns (Edwards 2010; Wilson 2016), the copper artifacts of the area remain under researched. Understanding copper procurement and its variation across this site grouping will add another aspect to the previously completed investigations.

### Physical Setting and Environment

The four sites of this study are located in Jefferson County, Wisconsin in an area known as the “Rock River-Lake Winnebago-Green Bay Lowlands region of the Eastern Ridges and Lowland geophysical province” (Schneider 2015:116) (Figure 1). Sites in this study mostly conform to typical Oneota settlement placement being clustered near bodies of water (Lake Koshkonong and Koshkonong Creek) with ready access to wetlands and arable fields (Edwards 2010; Foley Winkler 2011; Martin 1965; O’Gorman 1996; Rodell 1983; Wilson 2016). A limestone ridge follows the northwestern shoreline of Lake Koshkonong upon which three of the study sites – CAP, CBHC, and Schmeling – are located (Schneider 2015). This ridge has significantly eroded between CBHC and Schmeling, and between CBHC and CAP, possibly due to prehistoric springs (Edwards 2010; Schneider 2015). Beneath this eight-foot limestone ridge is an area of wetlands that extends east for 300 meters to the Lake itself (Edwards 2010; Schneider 2015). The setting for the site was likely selected due to its location within an oak savanna and proximity to prairie areas to the west (Edwards 2010). This environmental backdrop would have been conducive to a diverse subsistence strategy while also providing some protection against

natural elements and rival groups. Being near the CBHC and Schmeling sites, the Oneota component of CAP has a nearly identical physical setting (Spector 1975).

KCV diverges from this environmental pattern, as it is situated along Koshkonong Creek and much further away from Lake Koshkonong than other sites in the area (Carpiaux and Edwards 2014). Following the other three Oneota villages, KCV was also situated on top of a ridge and in proximity to wetlands that would have surrounded the creek (Carpiaux and Edwards 2014; Wilson 2016). In his catchment analysis of KCV, Wilson (2016:158) indicates that occupants at this site would have had “access to upland, wetland and aquatic resources, and diverse ecotones and plenty of arable land within a two-kilometer radius.”

### ***Prehistoric Copper***

By the time the Oneota occupied the shores of Lake Koshkonong starting around A.D. 1050, indigenous peoples of North America had been mining and manipulating native copper for almost 7,000 years (Ehrhardt 2009; Jeske and Hunter 2001; Martin 1999). Seriation of the material culture from prehistoric sites across the Eastern Woodlands and radiocarbon dates of associated organic material show that copper sources near Lake Superior have been exploited since the Middle Archaic, around 4000-3000 B.C. (Ehrhardt, Nash, and Swann 2000; Martin 1999; Pleger 1998; Stoltman 1986).

Additional studies demonstrate that copper and the knowledge to manipulate it were traded cross-continently by Archaic groups living near Lake Superior copper sources. Martin (1999) indicates that these groups lived in a social environment conducive to the exchange of ideas and technology. Evidence for this climate of exchange include the presence of exotic materials, especially foreign minerals and shells, in the archaeological record of sites and burials

across the Eastern Woodlands, as well as the appearance of similar forms, ideological symbols, and apparent manufacturing techniques of copper objects across numerous sites (Brose 1994; Martin 1999). Fogel's (1963) study of the variation in copper artifact densities across the landscape showed higher copper artifact concentrations near Lake Superior sources, that copper artifacts more frequently appeared in sites along waterways, and that the density of these artifacts dwindled as the distance from Lake Superior sources increased. Other studies showing Archaic trade practices include Popham and Emerson's (1954) investigations of the distribution of copper manufacturing techniques and Jury's (1965) support of proposed trade routes through the mapping of sites with known copper caches. Compositional analyses have shown that while groups outside of the Midwest may have relied on obtaining Lake Superior copper through trade during the Archaic period, they were able to locate and exploit copper more locally in subsequent eras and no longer needed to rely on trade to obtain the raw material (Ehrhardt 2009; Hill 2012).

Between the Archaic period and the emergence of the Oneota (A.D. 1000-1600), copper was integrated into the material culture of numerous North American prehistoric groups in many different forms and, presumably, functions (Ehrhardt, Nash, and Swann 2000; Plegier 1998; Jeske and Hunter 2001; Stoltman 1986). During the Middle and Late Archaic periods (4000-500 B.C.), copper was predominantly used in oversized tools that were mostly utilitarian, though they may have also had social and ritual significance (Binford, 1962; Byers 1999; McHugh 1973; Penman 1977; Plegier 1998; Wittry 1950). Following the Archaic, peoples of the Woodland period (500 B.C. to about A.D. 1200) living in the Midwest were using copper, possibly obtaining it through extensive networks, though they were using the raw material to create smaller, more compact tools, objects of personal adornment, and embossed sheets with ideological designs (Kocik 2012; Mississippi Valley Archaeological Center 2004; Yerkes 1988). Mississippian and Oneota groups

(A.D. 1000 to 1600) of the Midwest were utilizing copper similarly to Woodland groups (Ehrhardt 2009; Jeske and Hunter 2001). Copper appears in Mississippian and Oneota contexts as both utilitarian and decorative items, and includes awls and other smaller tools, objects of personal adornment, and elaborately embossed plates (Ehrhardt 2009; Hill 2006; Gibbon 1982; Overstreet 1997; Parkinson 2003; Sampson and Esarey 1993). Before copper fell out of favor and was replaced by European trade metals, ethnographers indicated that historic tribes including the Menominee, Sauk, Fox, Kickapoo, and Potawatomi utilized copper objects and regarded the material as having religious significance (Radin 1970 [1923]; Trevelyan 2004). Some ethnographic accounts indicate that copper ornaments were used to identify prominent individuals and households, and that the material was also used for utilitarian goods such as axes, chisels, knives, and spear and arrow points (Radin 1970 [1923]; Trevelyan 2004).

It has been argued that, throughout the history of its use, all copper objects, both decorative and utilitarian, held deeper social and ideological significance (Benn 1989; Binford 1962; Byers 1999; Martin 1999; Smith 2007; Pleger 1998). By using ethnographic analogy, the mythologies of historic Native American groups, and iconographic depictions found in the archaeological record, it has been speculated that the Oneota viewed copper as having cosmological connections to the underworld and its powerful spirits (Benn 1989; Martin 1999). Because of this ideological significance, it has also been said that copper was used by influential individuals to display their elevated status in the community (Benn 1989; Ehrhardt 2009).

The continuity of copper usage in prehistoric groups of the Midwest speaks to its significance in the economies, social interactions, and ideologies of these peoples. With such an extensive history of copper exploitation throughout prehistory and a dense accumulation of

literature about the material, expanding the research of Oneota copper specifically will be a useful contribution to the field.

### Mining and Trade

Since the copper deposits exploited by indigenous peoples of the Midwest are roughly 99.9% pure native copper, this metal is inherently malleable (Ehrhardt 2009; Martin 1999; Stoltman 1989). Prehistoric groups could mine, manufacture, and intricately manipulate this pliable metal without the knowledge of smelting (Ehrhardt 2009; Dahlen 2007; Martin 1999). Copper was extracted from exposed veins using heavy ground stone mauls (Martin 1999). Some have argued that fire was utilized to either soften the copper prior to harvesting, crack the surrounding rock for easy removal, or to help separate the copper from the surrounding bedrock (Cullen 2006; Griffin 1961a, 1961b; Landon 1940; Martin 1999; Stoltman 1986).

Hill (2012) and Levine (2007) indicate that while there has been much speculation of the exact location of copper sources exploited by prehistoric peoples, these claims have not always been scientifically tested. Prior to implementing archaeometric tests such as trace element analysis, researchers believed that indigenous groups only exploited the exposed copper veins in the Keweenaw Peninsula of Michigan's Upper Peninsula and Isle Royale located in Lake Superior (Dahlen 2007; Ehrhardt 2009; Fogel 1963; Landon 1940; Martin 1999; Penman 1977; Pleger 1998). Archaeologists have also historically attributed prehistoric copper sources to relatively common "float copper," or copper detached by glaciers from its original veins, carried for potentially hundreds of miles by these ice sheets, and deposited elsewhere in glacial till (Dahlen 2007; Ehrhardt 2009; Landon 1940; Penman 1977).

Compositional analyses have shown that the preferred copper sources of prehistoric groups shifted throughout time (Ehrhardt 2009; Levine 2007). Methods such as X-Ray

Fluorescence (XRF), Instrumental Neutron Activation Analysis (INAA), and Laser Ablation Inductively Coupled Mass Spectrometry (LA-ICP-MS) allow researchers to analyze the exact chemical composition of a material. These data can then be compared to the compositional signatures of known geologic sources of raw materials or the composition of artifacts from other archaeological sites (Hill 2012; Hill and Jeske 2011; Rapp et al. 1984; Vasilescu and Constantinescu 2011). While Lake Superior deposits and those around New Jersey and Nova Scotia were popular with earlier groups throughout the Eastern Woodlands, Middle Woodland and Mississippian groups of the southeastern United States started exploiting more local copper deposits (Ehrhardt 2009).

Hill and Jeske (2011) previously tested a small sample of artifacts from the Lake Koshkonong area using LA-ICP-MS, including three samples (an adze, awl, and fragment) from CBHC. Through these sourcing efforts, Hill and Jeske (2011) concluded that the copper from the Oneota component at CBHC closely matched that of the Middle Archaic occupation of the Reigh site in northern Wisconsin, the Riverside site located in the southwest portion of the Upper Peninsula of Michigan, and the Snake River region of eastern Minnesota. Copper from the Late Archaic contexts at CAP and the nearby Jaco site proved to also mirror copper found at the Reigh and Riverside sites, as well as the Snake River area of eastern Minnesota (Hill 2009; Hill and Jeske 2011). Middle Mississippian copper from Aztalan has similar composition to that from the Riverside site (Hill and Jeske 2011). While Archaic groups appear to have obtained copper from a variety of sources, later Oneota and Middle Mississippian groups residing in southeastern Wisconsin apparently exploited more easterly sources of the state. This shift led Hill and Jeske (2011:6) to suggest “either a fundamental restructuring of social interaction and territories between the Early Woodland and the period of site occupation [at Late Woodland CAP and

Oneota CBHC], or perhaps multiple occupations of these sites, or finally the possibility that copper artifacts were curated for generations.” Although the results of Hill and Jeske’s (2011) analysis is limited due to small sample sizes, their work provides testable hypotheses to help determine whether Oneota groups traveled or traded across the state to procure this raw material, if they were passing these objects down within kin groups, or if local float copper has similar chemical signatures to sources around Lake Superior and in eastern Wisconsin. Research along these lines using LA-ICP-MS is currently underway (Ahlrichs, personal communication).

### Manufacturing

By the tenth century A.D., Native Americans had developed an extensive set of copper manufacturing techniques including “shearing, grinding, molding, and burnishing” (Ehrhardt 2009:229). Starting in the Middle Woodland period, the common manufacturing processes for copper objects involved cold-hammering the material into sheets which were manipulated into various shapes, embossed with designs, overlaid on wooden or stone objects, or pressed into molds (Ehrhardt 2009; Ehrhardt, Nash, and Swann 2000). These processes were still used during the Mississippian period when they were refined to allow for the creation of copper foil, or sheets thinned to less than 0.05 mm (Ehrhardt 2009; Leader 1988). These finer, labor-intensive techniques probably elevated the value of this raw material within Mississippian and Oneota societies.

Microscopic analyses of copper tools have revealed that prehistoric groups annealed copper after cold hammering, since hammering damages the crystalline structure of copper, thus weakening it (Ehrhardt 2009; Martin 1999; Schroeder and Ruhl 1968). Annealing, which recrystallizes the structure of copper, involves reheating and cooling the manufactured object (Martin 1999; Schroeder and Ruhl 1968). Numerous microscopic studies of the crystalline

structure of prehistoric copper artifacts have shown that annealing had been part of copper manufacturing techniques since the Archaic, but was not consistently implemented at the same stage during the manufacturing process (Ehrhardt 2009; Ehrhardt, Nash, and Swann 2000; Schroeder and Ruhl 1968).

While other Mississippian groups like those at Cahokia, Spiro, and Etowah possibly included specialized copper craftspeople sponsored by elite individuals, there has been no indication of this specialization in Oneota societies (Benn 1989; Overstreet 1997). At this time, there is little evidence for the production of copper artifacts beyond a household level (Benn 1989; Overstreet 1997). It is possible that Oneota groups traded with other contemporaneous peoples to obtain specially-crafted copper objects. Hall (1962) notes that the serpent pendants found at Wisconsin Oneota sites are common at the Etowah site in Georgia and indicate possible interactions between these groups.

### Use-Wear Analysis

Archaeologists have developed increasingly successful methods of use-wear analysis on stone tools since the late 1970s (Newcomer and Keeley 1979; Odell 1979; Odell and Odell-Vereecken 1980). By creating comparative collections through experimental archaeology, researchers are able to analyze micro and macroscopic damage and polish on stone tools in order to determine both the type of material on which the tool was used and the direction of its use (Newcomer and Keeley 1979; Odell 1979; Odell and Odell-Vereecken 1980).

Though use-wear has become a respected method of analysis in the study of stone tools, it is not as commonly used in research on metal objects. The malleability of native copper allows for extensive post-depositional and modern wear. Additionally, corrosion and patina often

obscure the surface of copper artifacts, hindering microscopic use wear analyses. Despite these drawbacks, in their study of European metal tools, Kienlin and Ottaway (1998) argue for the utility of use-wear analysis for bronze and copper artifacts. Their methods mirror that of lithic use-wear studies: using prehistoric construction techniques and materials to create replica tools; documenting the manufactured tools prior to use; using these tools repetitively on the same material and in the same motion (e.g. stripping the bark off of a tree branch); observing and documenting the used tools macroscopically and microscopically to determine traces of use; and, finally, comparing signs of wear on the contemporary tools to marks on archaeological specimens (Kienlin and Ottaway 1998). Kienlin and Ottaway (1998) concluded that their study demonstrated a successful application of use-wear analysis on metal tools, and advocated the continued use of this analysis and improvements on its methods for future research on bronze and copper tools.

Dolfini (2011) also argues for the utility of use-wear analysis in her study of copper artifacts from Copper Age Italy (3600 to 2200 B.C.). Her methods mimicked those utilized by Kienlin and Ottaway (1998) and were also found to provide detailed results of the use of various copper artifacts (Dolfini 2011). In addition to being able to define if an object was used, in what capacity, and on which type of material, Dolfini (2011:1037) could discern that some axes had functional use-wear but were taken out of circulation while they were still functional and placed into ritual contexts, which “suggests that deposition practices bore a loose relationship, if any, with the functional value of the tools.” The major weakness of this line of investigation that Dolfini (2011) points out is the lack of comparative studies completed within the discipline. Additional use-wear studies will strengthen this method and provide empirical evidence for assumed functions of copper artifacts.

In 1984, April Sievert Hohol addressed whether use-wear analysis of Old Copper implements in the Field Museum could be conducted successfully. She utilized categories of wear that are similar to Penman's (1977) early use-wear analyses, which include stress, striation, smoothing, and edge attrition (Sievert Hohol 1984). While she identified some aspects of these archaeological materials that may hinder use-wear analyses – such as patina and damage from museum exhibition and storage, contemporary artifact handling and reuse, and natural decomposition – Sievert Hohol (1984) concluded that it is possible to study use-wear on Old Copper artifacts if observations are restricted to damage that occurred prior to surface patination.

### Ideological Significance of Copper in Prehistoric Societies

Utilizing ethnographic analogy and historical accounts, researchers have been able to theorize the ideological significance of copper in prehistoric societies. *Ideology* is used in this thesis to describe the world view shared by a group of individuals, as well as the social practices and material culture that it requires to function (e.g. beliefs, rituals, values, religious memorabilia, sacred symbols) (Van Dyke 2011). Similarly, this thesis follows other researchers (e.g. Baines and Yoffee 2000; Joyce 2000; Van Dyke 2011; Wolf 1999) who have argued that a group's ideology could be manipulated by leaders or powerful individuals through control over ideological practices or substances, which could be used to further a world view that supports social inequality. Ideological functions of artifacts often overlap with their social functions since ideology often inspires social organization. For the purposes of this thesis, an object's *social function* is defined as its role in personal or group relationships, such as social or political status.

Trevelyan (2004) has highlighted the longevity of copper use in ritualized contexts of Eastern Woodland groups throughout prehistory. The frequent placement of this material in ritual contexts, especially burials, points to the importance of copper in establishing personal and

group identities (Byers 1999; Dolfini 2011; Reilly 2004; Trevelyan 2004; Winters 1981).

Trevelyan (2004) also notes that various ethnographies of early historic groups indicate that copper was used to distinguish individuals of higher social standing and that large boulders of this material were considered by some prehistoric groups to be deities in themselves. The material may also have had religious significance due to its red color, which was ideologically important to prehistoric and historic groups and often symbolized blood, fire, and the sun (Kelly and Brown 2012; Trevelyan 2004).

Prominent animals in prehistoric and historic ideology are also often depicted in copper. Falcons, serpents, and water panthers were important mythological animals to Middle Mississippian and Oneota groups (Benn 1989; Trevelyan 2004). Being from the underworld, the serpents and water panthers are also described in oral traditions as having copper body parts (Benn 1989; Ehrhardt 2009; Martin 1999; Trevelyan 2004). Elements and characters of these animals who reside in the upper and lower celestial realms were also often mixed together in fetishized bundles and artistic representations (Benn 1989; Berres 2001; Trevelyan 2004). This practice mimics the myths of hawks and men capturing snakes to harness their power and gain control of the various spiritual planes (Benn 1989; Berres 2001). Serpentine pendants, like those analyzed in this study, have been identified as snakes, hawk feathers, or the copper tail of the water panther who resides in the underworld (Benn 1989; Hall 1962; Martin 1999). Trevelyan (2004) also indicates that snakes, falcons, and felines are commonly depicted in decorative copper artifacts and that their symbolic forms are often combined to depict hybrid animals.

## Oneota Copper

Despite a history of archaeological research with Archaic copper materials, intensive archaeological investigations and application of theoretical models have not been specifically applied to Oneota copper material culture. Since this substance has a tradition of being placed “in elaborate burials within mounds or other situations of obvious ceremonial significance,” detailed applications of anthropological theories on social inequality and ideology are necessary (Trevelyan 2004:116).

Copper was frequently used by the Oneota to create utilitarian and decorative items. Awls, needles, beads, and pendants are among the artifact types commonly found in Oneota contexts (Hill 2006; Jeske 2003; Overstreet 1997). A specific typology for Oneota copper artifacts does not currently exist or, at least, is not commonly used by archaeologists in publications. When discussing these objects, scholars default to Wittry’s (1950) classification of Old Copper Complex material culture, use types found in lithic typologies, or categorize artifacts in broad, generalized types such as *awls*, *globular beads*, or *perforated disks* (Gibbon 1973; Hall 1962; Hill 2006; O’Gorman 1993; Parkinson 2003; Overstreet 1997). Such types are problematic as they imply specific uses without testing these assumptions and ignore the ideological and social significance of functional items.

Some archaeometric work has been done with Oneota copper artifacts, as previously mentioned. Hill and Jeske (2011) investigated potential copper deposits exploited by Lake Koshkonong Oneota groups and found that the preferred deposits found in eastern Wisconsin and northern Wisconsin/Michigan differed across time. Still unresolved is the specific method of retrieving copper material from these deposits across the state and the social practices surrounding its procurement and manufacture. Since glacial till is commonly found in the Lake

Koshkonong region, it is also likely that copper artifacts found at the Oneota sites in this area simply utilized local float copper to manufacture objects (Schneider 2015).

Foley Winkler's (2011) discussion of copper artifacts found within burial contexts provides unique insight into the possible ideological and social roles that this raw material was given within Oneota communities. While Foley Winkler (2011) describes a relative lack of copper artifacts found overall among Wisconsin Oneota burials (only 7%), she indicates a slightly higher proportion of copper placed in burials at the Walker-Hooper site in Green Lake County, Wisconsin (4%) and the Hoxie Farm site in Cook County, Illinois (14%). Her description of the burials at Hoxie includes the following:

A copper bracelet was recovered with a subadult from Walker-Hooper and otter skulls with copper eyes were recovered from Hoxie. Here the form of copper is important because it appears to reflect either agency as with Walker-Hooper or possible clan associations with Hoxie [Foley Winkler 2011:141].

Foley Winkler (2011:163) concluded that Wisconsin Oneota burials contain more copper than Langford burials, which may imply varying group identities; however, "their significance in Oneota mortuary ritual may be more statistical than actual" since only 7% of burials contained copper goods.

### CHAPTER 3: METHODS

Data collection methods were developed and standardized with Robert Ahlrichs, a graduate student at UWM researching the Archaic copper pieces in Mr. Jim Bussey's private collection. Standardization of these data should allow for future comparisons. In addition, the variables recorded by Dahlen (2007) in his research on Ioway copper artifacts were consulted to establish comprehensive documentation procedures.

The data collected from artifacts in the assemblage were documented in an Excel spreadsheet and later populated into the copper artifact form seen in Appendix A. Characteristics recorded on this form include the artifacts' alphanumeric catalog number, dimensions, patina, morphofunctional designation, wear, manufacturing stage/processes, reported and/or analyzed provenience, inclusion of organic residue, and an image of the object. The information recorded in the Excel spreadsheet was standardized and coded for more efficient documentation and analysis. For an entire breakdown of this coding schema, see Appendix B.

#### *Alphanumeric Catalog Numbers*

The alphanumeric catalog numbers given to each object consist of multiple parts. The first letter of the artifact's number designates from which collection the artifact originates. These abbreviations are as follows:

- C = Objects unearthed during UWM field school excavations of the Crescent Bay Hunt Club site (47JE0904)
- K = Objects unearthed during UWM field school excavations of the Koshkonong Creek Village site (47JE0379)
- S = Objects from the Schmeling Collection from the Schmeling site (47JE0833)

- B = Objects from the Bussey Collection that were unearthed from Crabapple Point (47JE0093)

After this initial letter, some collections were given an additional prefix. For collections from CBHC and KCV, the object was also given the last two digits of the year in which the object was excavated (e.g. K12 means that this object was excavated from KCV in 2012). The Bussey collections were also given an additional prefix that denotes their original storage container. Since all of Bussey's trays were given a number, this tray number was placed after the *B* designation (e.g. B72 means that this object was originally stored in Bussey's tray that was labeled 72). Some of Bussey's objects were also stored in a white tray that was designated *W* (e.g. BW) and another group of objects was stored in a bag of presumed scraps that was given the additional prefix *SB* (e.g. BSB). Objects from the Schmeling collection were given no additional prefix.

After this prefix and separated by a hyphen, all objects were given a number that was unique to each piece in the collection. This number was assigned arbitrarily in order to serve as a unique identifier for objects so that they can be referenced in the analysis of this research project. For example, one artifact from KCV may have an alphanumeric catalog number of K12-5, which would mean this is the fifth documented artifact of the KCV collection from the 2012 excavations.

Objects with multiple parts were denoted by adding a letter at the end of the catalog number. If the previous example of K12-5 had two parts, these parts would be numbered K12-5A and K12-5B.

### ***Morphofunctional Designations***

Since an established typology of Oneota copper artifacts does not exist and developing one is beyond the scope of this thesis project, artifacts were given a general morphofunctional designation. After preliminary observations of the collection, the categories designated were *bead*, *awl*, *pendant*, *tinkler cone*, and *fragment* (Martin 1999; Trevelyan 2004; Walder 2015; Wittry 1950). It is not the intention to ascribe an intended function via these designations, but to group the objects by similar form using terminology frequently used by the archaeological community. An assessment of the validity and usefulness of these terms will require additional research.

### ***Describing Patina and Corrosion***

Since the majority of objects are covered in patina and corrosion, a notation of these effects was documented. Patina is defined as a “colored layer on the surface of a metal, often a copper alloy” (Motley 2010:68). Since patina is defined as being a colored layer, lettered categories were arbitrarily assigned to types of patina found in the collection based on its color. These categories are:

- Type A: A very common patina that is seafoam green in color (Munsell 2.5G 9/6, very light yellowish green).
- Type B: Vibrant teal in color (Munsell GLEY1 3/5, very dark grayish green), this patina is often thicker, has a dull luster, and sometimes is found on accretions.
- Type C: Another common patina, Type C is dark reddish brown in color (Munsell 2.5YR 3/4, dark reddish brown) and often has a dull appearance and slightly pitted surface.

- Type D: This patina is usually thicker or accompanied by an accretion and takes on a dark brownish black color (Munsell 7.5YR 2/5, black).
- Type E: Only appearing on a few objects, this patina is rusty yellow in color and appears dull (Munsell 5YR 5/8, yellowish red).

Other types of deterioration that were noted include accretions and pitting. Accretions are defined as the “accumulation of extraneous materials on the surface [of an object],” and are present on virtually all of the objects in the collections (Motley 2010:70). Pitting also occurs regularly, and can be described as “small, irregular, shallow, pinhole-sized losses scattered over the surface of metal, caused by acidic conditions or resulting from the casting process” (Motley 2010:71).

The percent of the total surface area of the object covered by patina and/or corrosion was documented, and appears to be 100% for all objects. This rampant deterioration is important to note since it hinders observation of the original surface of artifacts in the collection; especially delicate, decorative incisions.

### ***Documenting Use-Wear***

April Sievert Hohol is one of the few researchers who have performed use-wear analysis on North American copper implements. In her 1984 dissertation, Sievert Hohol delineates a schema for observing and documenting use-wear on copper implements. This schema was adapted for documenting use-wear on the artifacts of this thesis project. Sievert Hohol (1984a:17-20, emphasis added) describes these use-wear categories as:

**Stress damage** - which includes battering, cracking or bending damage. Stress damage implies heavy, impactive use [...].

**Mushrooming or splaying** of edges was taken to be indicative of battering. For example, if a tool was used as a wedge, mushrooming would be expected on both proximal and distal ends. Smashing or bending back of edges could indicate pressure stresses.

**Cracking** may occur as a result of stress applied to anneal sutures. Cracking could occur also from environmental, or freeze/thaw stress. Fracture could result from excessive stress during use.

**Bending** may result from excess pressure being applied to the tool against an unyielding worked material. Bending would occur more often to thin elements or elements held obliquely to the point of pressure. Bending might also occur at junctions of structurally weaker elements [...].

**Striation** - The softness of copper makes it prone to striation resulting from use, manufacturing techniques or weathering. Semenov (1964) remarks that striation is the most significant clue to reconstructing kinematics of use, and that metal tools pick up use striations more easily than do any other. [...]

**Smoothing** - Smoothing or polishing of the edges should be characteristic of copper tools. Such reduction in topographic relieve or polish could result from:

Extended **use** which would buff areas to a polish. For areas to become polished through use, the worked material must be relatively soft and yielding, otherwise the surface would abrade.

Intentional **pre-use** polishing by the manufacturer. Here, if polish is a technique sought by the manufacturer, it ceases to be a true indicator of use. However, it seems more likely, in light of sour marks customarily found on the surface, that scouring, not polishing was the method of finishing surface areas.

**Incidental** polishing could occur through handling or friction against haft or bindings. Hand held tools might become polished from repeat handling.

**Retooling** - Evidence of retooling would also be indicative of use. For copper tools, the following types of retooling would be expected.

**Resharpening** - is indicated if edges are found to have overlapping layers of beveling striation. [...] Resharpening is also suggested when, in pieces for which edge striations are absent, the edges show thinning (Penman, 1977). Also, morphological changes such as systematic straightening out of convex edges can result from repeated re-sharpening.

**Repair** - Repair could take on a number of potential forms. [Sievert Hohol assumes] that the most common would be the hammering straight of bends or twists in the metal that result from use. [She expects] that stress marks of some type would betray the presence of repaired bending.

Sievert Hohol (1984a:23-24, emphasis added) also categorizes recent alterations, and describes this type of wear as:

**Recent alteration** - When using artifacts which were possessed by private collectors for many years, there is uncertainty regarding treatment that the artifacts may have received. Three sources of potential alteration exist:

**Cleaning** - or removal of patination from an artifact by means of abrasives can disrupt traces of striations or polishes resulting from prehistoric use or manufacture.

**Recent use** - Due to the similarity of [prehistoric] tools to many kinds of modern tools [...] some artifacts may have been utilized post-discovery.

**Curation** - Methods of curation could also affect the artifact. For example, two awls show a similar pattern. At approximately 2-3cm from each end there are transverse striations which appear to be recent since they cut deeply into the natural patina. These could only have been caused by thin wires having been used to hold the piece, most likely for display purposes.

In addition to Sievert Hohol's designations, three categories were created to describe damage not included in her schema. These three categories are *incisions*, *loss: broken piece*, and *loss: nicks*. Incisions differ from striations by penetrating deeper into the object's surface and may sometimes be interpreted as decorative elements. This term also has an implication of intentionality. Where striations are byproducts from manufacturing methods or wear, the depth and placement of incisions indicate that the manufacturer intended for them to be clearly visible on the final product.

The two loss categories were created to indicate objects that appear to have lost a portion of their original manufactured form. *Loss: broken piece* is a category designed for fragmented objects, such as those that have previously broken in half. The *loss: nicks* category is to note

those artifacts with small missing pieces, such as a bead with a portion missing from its edge due to extended use.

With these few additions, the documentation of wear followed previous studies by Sievert Hohol (1984) and included a column for detailed notes of potential signs of wear. Each piece in the collections was observed both macroscopically and with a 10x loupe in order to more accurately complete use-wear and manufacturing notes. Though this documentation may not allow us to infer exact uses for the Lake Koshkonong copper artifacts, it will demonstrate to the utility of use-wear documentation and analysis on North American metal artifacts.

### ***Manufacturing Notes***

Since the manufacturing techniques of copper objects differ throughout time, the potential construction methods of artifacts were also noted. A qualitative note on their *level of manufacture* was included in the Excel spreadsheet, which includes the categories: unmodified (for pieces of raw native copper), some modification (used primarily for scraps and fragments), prepared blanks (fragments of copper prepped for artifact manufacture), roughly manufactured artifacts, moderately refined manufactured artifacts, finely manufactured artifacts, and manufactured artifacts probably significantly distorted after deposition. Understanding the state of these materials in the manufacturing process may be helpful in dating these objects, identifying a manufacturing tradition, and analyzing the modes of production occurring at each site.

In addition to the level of manufacture, possible shaping and manufacturing methods were noted also, as well as any possible decorations. Finally, the shape of the object's cross section was documented also, since this is a characteristic noted in other copper analyses and

could be used in future comparisons. By collecting these data, this project aims to glean information from the collections that might indicate who made these objects, when, and what methods they used.

### ***Other General Data Recorded for All Objects***

The final section used in documenting all objects includes information pertaining to each artifact type. These data include the artifact's weight to the nearest tenth of a gram and whether the object includes any organic residue. The date that each object was photographed was also noted, along with the number assigned to the digital image file by the camera. This section also includes a general *Comments* area, where any information not covered by the other sections in the spreadsheet was addressed, as well as a space to note the date of the record entry and the individual recording the information (JMP = Jacqueline Marie Pozza).

### ***Object Orientation and Lexicon***

In order to orient readers while describing artifacts, a lexicon was developed for the various types of objects found in these collections.

#### **Awls**

Awls have two *ends* and a *body* (Martin 1999; Trevelyan 2004; Walder 2015; Wittry 1950). Where the end stops and the body begins is not a definite point, but can roughly be identified as the area where end use/wear/shape stops and the body shape begins. This type of artifact was oriented with the end type first categorized in the end shape columns (columns AT to AX reading left to right) pointed down (or toward the observer), the second documented end type

pointed upwards (or away from the observer), and the object lying flat on a table. The end pointed toward the observer was referred to as *End 1*, and the end pointed away was described as *End 2*. If ends have the same type of shape and are noted together in these end type columns (e.g. if both ends are pointed), then the titles of *End 1* and *End 2* were arbitrarily assigned and this assignment was described in the Comments section of the awl's entry.

### Beads

Terminology for parts of a bead's anatomy must also be standardized to facilitate written descriptions of these artifacts, so a detailed lexicon was developed for the beads. Each bead is made out of a strip of copper with one edge of the seam rolled over the other. The side of the bead that is rolled over the other to create the seam of the bead was referred to as the *rolled over side*. The side tucked under this was deemed the *rolled under side*. Beads were oriented with their seam facing upwards, and the *rolled over side* on the right. Most of the beads are slightly flattened on the side opposite their seam, and, therefore, naturally sit on a flat surface with their seam facing upward. The side opposite the seam edge that rests on the table when oriented properly was described as the *side opposite seam*.

The two edges of the bead that are perpendicular to the seam were referred to as the *top bead edge* and the *bottom bead edge*, which is possible due to the bead's orientation described above. The edge of the rolled over side that is roughly perpendicular to the top and bottom bead edge was called the *rolled over seam edge*, and the edge of the rolled under side was deemed the *rolled under seam edge*.

## Tinkler Cones

Tinkler cones, also known as *tinkling cones*, are similar to rolled beads and thus were described using similar terms (Martin 1999; Trevelyan 2004; Walder 2015; Wittry 1950). The most significant difference between the two artifact types is that tinkler cones are intentionally made to be more cone-like than tube-like in shape. This cone form dictated the orientation of the object for description purposes. Since the tinkler cone is attached by threading a rope/string/lock of hair through the smaller end of the cone and knotting it, this smaller end was considered the *top* of the cone. The wider end was referred to as the *base*. Following this trend, the two edges of the tinkler were described as the *top edge* and the *base edge*. Similar to the beads, the cone's *seam* faced upwards. All other terms delineated in the bead lexicon were used for tinkler cones, including *rolled over side*, *rolled under side*, *rolled over seam edge*, *rolled under seam edge*, *top cone edge*, *bottom cone edge*, and *side opposite seam*.

## Pendants

Pendants similar to those in this assemblage have been referred to as *symbol badges* (Hall 1962; Martin 1999; Trevelyan 2004; Warring and Holder 1945; Walder 2015; Wittry 1950). In order to orient pendants for descriptions, their attachment feature (either a rolled over end or punctures through which a rope could be strung) was placed away from the observer. The front side of the pendant was also determined by its attachment. For pendants with attachments made by a rolled over end, the front was the side with the rolled over attachment and the back was the side that is flat. Pendants with punctures for attachments were oriented with pushed-in side of the puncture facing upwards and the flared-out side of the puncture hole being towards the back.

The portion of the pendant with the attachment feature was referred to as the pendant's *head*, and the rest of the pendant stemming from this head was called the *body*. The termination of the pendant opposite the attachment was deemed its *end*.

### Copper Fragments

The final general object type present in the collections are copper *fragments*, which are a conglomeration of what other researchers have referred to as *scrap*, *waste*, *wire*, and *blanks* (e.g. Walder 2015). These are pieces of copper that have no other distinguishable shape. This term does not infer that these objects are necessarily broken or that they are part of a whole, it merely denotes that this item has no resemblance to the other artifact types (awls, beads, tinkler cones, and pendants) and may either be a byproduct of manufacturing other pieces, an unfinished piece, or unaltered native copper.

In order to orient these pieces, its longest dimension was used as its length. Its width was then measured perpendicularly to this length measurement. If there was a flatter edge present, this edge was used to help orient the object, and measurements were taken parallel and perpendicular to this edge, not diagonally.

### ***Unique Documentation for Specific Artifact Types***

Each artifact type has unique characteristics, so additional sections in the Excel spreadsheet were designed specifically to collect data that are only applicable to that type of artifact. Standardized measuring methods were also addressed. Because of the delicate size of many of the collection's objects, all measurements were taken to the nearest hundredth of a millimeter. For consistency, maximum measurements were recorded. While deciding how to

measure artifacts in the collection, efforts were made to consider intentionality. The measurement methods described below were designed to create an effective and standardized measuring procedure for replicable data collection and to investigate features that may have been purposefully shaped during manufacture. For a full breakdown of spreadsheet documentation of each artifact type, see Appendix B.

### Awls

The two ends of the awl were documented first. Terms used to describe their shape were *pointed* (for needle-like ends), *tapered* (for ends that were not exactly pointed, whether this be by intentional manufacturing or from extensive use), *flattened* (abrupt, relatively clean ends that were roughly perpendicular to the awl's body), *splayed* (a flared out, mushroomed end that may have been intentional from manufacture or is a result from use), and *broken* (a term used to describe the fractured end of an awl).

Maximum length was recorded, along with the width and thickness of the awl's body and each end. Width and thickness measurements were taken at the approximate center of the awl's body and about one millimeter away from each end. The largest measurement of the center of the body determined the direction of the width measurements. Thickness measurements were perpendicular to width measurements. Measurements of the two ends were in the same direction as those at the center. The angle of pointed and tapered ends of awls was also documented. If there was more than one edge that was pointed and/or tapered, the angle of Edge 1 was listed first, followed by a comma and the angle of Edge 2.

## Beads

Numerous data were collected for beads, including whether their edges were cleanly or irregularly cut and the amount of overlap of the two seam sides. The shape of the rolled over side edge was also described. Whether this edge was *squared* (cleanly cut and perpendicular to the beads' edges), *irregular* (not cleanly cut and somewhat smaller/larger than the bead's length), *flared* (noticeably larger than the bead's length), or *tapered* (significantly smaller than the bead's length) may indicate a difference in manufacturing technique.

On many of the rolled under seam edges, the extreme end is pinched inward and away from the rolled over side. During initial observations of the collections, the frequency of this modification on beads in the collection suggested its potential importance in identifying manufacturing procedures. This feature was noted as the rolled under side edge being *pinched*.

Two unique shapes of beads were also noted. Beads notated in this thesis as *globular* shape were wider than they were long or roughly the same in width in length. Globular beads also were spherical and bulge out in the center of their side. While all beads could be described as tubes, *tubular* beads were significantly longer than they were wide. Their diameter was much smaller, and their length was significantly longer than the average bead. These terms were intended to act as general descriptions of a bead's shape, and were not designed to be used as a specific bead type.

The final feature of beads that warranted special terminology was the alignment on the seam edges. Beads with their rolled over side and rolled under sides relatively aligned to create flat bead edges were described as *flush*, whereas bead sides that were not aligned, resulting in uneven bead edges were called *askew* for this thesis project.

Three lengths were taken: the maximum length of the bead, the length of the seam, and the length of the side opposite the seam. The width of the bead was measured with the bead sitting on a flat surface with its seam faced upwards. Two measurements were taken of the bead's thickness about two millimeters from the bead edge with one taken on the side opposite the seam and one from the rolled under side as closely to the overlap with the rolled over side as possible. Efforts were made to ensure that only the thickness of one layer of the bead was measured and in an area with the least amount of accretions. Finally, the bead's orifice was measured across both of the bead's edges.

### Tinkler Cones

The tinkler cone documentation and standardized measurements were almost identical to the bead section with a few exceptions. There were no special shapes assigned to tinkler cones and no formal typology has been developed for this object type in the archaeological literature. However, Walder (2015) has suggested the possible importance of the closure type of cones (abutted or overlapped). This feature was noted for tinkler cones in the "amount of overlap of seam sides" column. Two widths of the cone were measured instead of one: one at the top of the cone (the smaller end) and one at the base of the cone (the larger end). All other measurements followed the bead methods.

### Pendants

Pendant form varies greatly, so the spreadsheet was designed to incorporate descriptions of this variety. The pendant's *attachment type* was first recorded. Attachment features manifest in two forms: a rolled over end or punch(es) in one end of the pendant.

Pendants take on a variety of forms. Categories of *pendant shape* were based on the general form of the object. These categories include an *indeterminate shape* (mostly for small, fragmented pieces without a discernable shape), *serpentine* (pendants with semicircular bends), *circular*, *mace-shaped* (resemble a prehistoric mace or upside-down cross, also noted as acorn or keyhole pendants in literature), *talon-shaped* (similar to a raptor talon in shape), *point-shaped* (for pendants that are shaped like unnotched/unstemmed projectile points), *teardrop-shaped*, and *trapezoidal* (Hall 1962; O’Gorman 1996; Trevelyan 2004; Waring and Holder 1945). Any additional details about the shape of the pendants were noted in the general comments section.

The shape of the side opposite the attachment feature, or the pendant’s end, was also documented. Options for this column include *broken* (for pendants that were previously broken and their original end no longer remains attached to the object), *pointed* (coming to a sharp point), *tapered* (coming to a gradual point), *square*, *polygonal*, and *rounded* (for circular or teardrop pendants).

Three length, two width, and two thickness measurements were taken for pendants. A pendant’s head (or area with attachment feature) and body were measured separately, along with the pendant’s full length. The maximum width of its head and body was also measured. Two thicknesses were measured, one at the center of the pendant’s head and one at the center of its body.

### Copper Fragments

Since copper fragments are mostly non-diagnostic, only a few kinds of data were collected. The object’s general shape was noted (*round*, *triangular*, *oval*, *square*, *polygonal*), with *irregular* being reserved for those fragments with unique shapes that do not fit within the

other categories. Based on this shape and a general observation of the piece, an intended final form may be suggested. The categories for this *possible intended final form* include *indeterminate* (for artifacts that were too early in the manufacturing process to determine a final form, were never intended to be made into a final artifact, or were fragments of copper not manipulated by an individual), any of the other artifact categories (*awl, bead, pendant, fragment, tinkler cone*), or an *other* category. If *other* was used, then a description of this form was included in the comments section.

Finally, three measurements were recorded for each fragment. The longest measurement was recorded as its length. Once a length was established, width was measured perpendicular to the length. The maximum thickness of the fragment was also recorded.

## CHAPTER 4: RESULTS

The Lake Koshkonong copper collections consisted of 636 objects. Data gathered from these artifacts are detailed in Appendices C through H. Morphologically, the collections consist of 83 awls, 320 beads, 67 pendants, one mace, two adzes, one possible fish hook, one possible broken projectile point, one coiled object, and 158 fragments. The Schmeling collection also included two tinkler cones; however, these appear to be made from bronze and are likely from historical context (Kevin Schmeling, personal communication). This wealth of data provides insight on the distribution of copper and artifact types across the four sites, as well as Oneota copper manufacturing practices, uses, and possible ideological significance of this material.

### *Distribution*

The most glaring contrast between these assemblages is the amount of copper in each collection. CBHC yielded 11 copper objects, 19 were found at KCV, and the Schmeling collection included 23 copper pieces, whereas 583 pieces of copper were recovered from CAP. Comparisons of the total weight of copper recovered from each site show that CAP accounts for over two-thirds (67.1%) of the overall copper recovered from this area, and that this site also vastly dominates the distribution of each artifact type (Figures 3 and 4).

This discrepancy is undoubtedly due largely to the different methods in which the artifacts were recovered. KCV and CBHC artifacts were excavated during University of Wisconsin-Madison (UW) and UWM field schools (UW 1968 and UWM 1998, 2000, 2002, 2004, 2012, and 2014), while the Schmeling materials are part of Mr. Keven Schmeling's small private collection obtained by surface collecting plowed fields. Despite three seasons of field walkover and excavation of eight two-by-two meter units, including three bundle burials, no

**Figure 3. Comparing copper distribution by site.**

copper was recovered by UWM field schools at the Schmeling site (Foley Winkler 2006, 2008). Conversely, the CAP copper artifacts are the result of decades of metal detecting by Mr. Jim Bussey. Despite this difference in recovery method, the immense discrepancy in copper density between the sites warrants a closer look.

A significant piece of partially-worked native copper at Schmeling, weighing 275.0 grams, implies that this material was distributed in large, semi-processed segments that were later manufactured into numerous individual objects. Considering the average weight of items in the study collections, 2.1 grams, this flattened, irregular piece could have provided enough

**Figure 4. Comparing artifact type densities by site.**

copper for roughly 131 artifacts of average size, increasing the total number of Schmeling copper artifacts by almost seven times.

The majority of the artifacts in the study collections have very limited provenience. The copper from the Bussey and Schmeling collections originates from private collections and has no contextual information except for a general site location. Conversely, artifacts recovered from CBHC and KCV were excavated by UWM field schools, and their context was fully documented during excavation (Table 1). These objects were primarily found in utilitarian contexts, such as in refuse pits among animal bone and ash. However, some human remains have been found within wild rice threshing pits that were later used for refuse. One of these pits yielded a copper bead recovered in a lower zone and a human maxilla and bear canine in an upper zone. While this pit does not appear to be a formal burial, as only one human bone was placed within this context, the presence of the copper bead, human maxilla, and bear canine in this provenience suggests that these pits may have been more than strictly utilitarian. The possible fish hook from CBHC was found within a hearth, and six fragments were found among the fill of a wild rice threshing pit turned refuse pit at KCV. One fragment was uncovered from a large partially excavated circular feature of unknown function during the 2014 season at KCV. These depositional contexts; refuse pits, a fire hearth, and a post hole; suggest that the associated copper was used for daily tasks within households. Additional excavations at CAP and Schmeling may reveal additional copper in similar domestic contexts. None of the formal human and dog burials found at CBHC, Schmeling, or KCV included copper burial goods (Foley Winkler 2011; R. Jeske 2016, personal communication).

**Table 1: Context of copper from CBHC and KCV.**

Site, Field Season	Provenience	Interpretation of Context	Copper Recovered
CBHC, 1968	Plow Zone	Plow Zone	1 serpentine pendant 1 fragment
CBHC, 1998	Unit 98-07, Level 00	Semi-conical pit	1 bead
CBHC, 2000	Unit 00-05, Level 01		1 fragment
CBHC, 2002	Feature 02-10	Possible refuse pit	1 adze
	Feature 02-25	Fire Hearth	1 fragment
	T7-P7		1 fragment
	Unit 02-05, Feature 02-32, Heavy fraction	Posthole	1 awl 1 fragment
CBHC, 2004	West block, Feature Trench Fill 04-27, Level 02	Shallow pit feature possibly related to house floor nearby	1 fragment
CBHC, 2010	Feature 10-19, Unit 10-10, Heavy fraction	Pit feature	1 awl
KCV, 2012	Unit 12-01,02,03,04, Feature Fill 12-01, Zone E	Wild rice threshing pit – First fill of feature dense with faunal bone	1 fragment
	Unit 12-01,02,03,04, Feature Fill 12-01, Zone H, Heavy Fraction	Wild rice threshing pit – Rodent Run	2 fragments
	Feature Fill 12-01, Zone I, Heavy Fraction	Wild rice threshing pit – Fill with fish bone	3 fragments
	Unit 12-01,02,03,04, Level 02, Feature Fill 12-01, Level 01, Zone P	Wild rice threshing pit – Plow fill	2 beads 1 pendant 1 fragment
	Unit 12-01,02,03,04,05,06, Feature Fill 12- 06, Zone A2	Wild rice threshing pit turned refuse pit	1 fragment
	Feature Fill 12-06, Zone O, Heavy Fraction	Lens with fish bone and scales	2 fragments
	Unit 14-02, Level 04, Feature Fill 14-02, Zone A	Wild rice threshing pit turned refuse pit. Human maxilla and bear canine found in upper portion of feature	1 bead
KCV, 2014	Unit 14-05, Level 01, Area C and G	Plow zone	1 awl
	Unit 14-01, Feature Fill 14-18, Zone C	Ash lens	1 fragment
	Unit 14-01-02, Feature Trench Fill-05	Small circular feature, possibly a refuse pit	1 fragment
	Unit 14-01, Level 02, Feature Trench Fill 14-18	Pit feature that is roughly circular, possibly a refuse pit	2 fragments

## ***Manufacturing***

Dolfini (2010) distinguished damage on copper artifacts caused by manufacture from that originating from deposition in her investigation of casted copper-based Italian artifacts of the Copper Age (3600 to 2200 cal. B.C.) (Table 2). This differentiation between manufacturing and use-wear acted as a guideline for observing wear on the surface of the Lake Koshkonong Oneota copper. Strict adherence to Dolfini's (2010) scheme was not possible, since varying manufacturing methods were employed to create casted copper-based artifacts and hammered

**Table 2: Designations of wear on Copper Age Italian copper-based artifacts (Dolfini 2011:Table 1).**

Traces	Features recorded
<i>Manufacturing traces</i>	
Hammering marks	Hammering facets. <i>On axes</i> : thickened or raised flanges
Grinding and polishing marks	Pattern of scratches from butt/heel to cutting edge/point. <i>On axes</i> : pattern of scratches parallel to cutting edge
Others	Rough surface; casting seams. <i>On axes</i> : shrunk butt; concave sides; bevel near the cutting edge
<i>Wear traces</i>	
Cutting edge bluntness	Blunted, bent or flattened cutting edge
Striations	Scratches and scrapes on the cutting edge. <i>On axes</i> : scratches extending less than 2cm back from the cutting edge
Sharpening traces	Tight patterns of short scratches on the cutting edge; crisp cutting edge; size reduction
Asymmetry	Asymmetrical tool or cutting edge
Others	Hafting marks; all other marks covered by the patina
<i>Post-depositional traces</i>	
Post-depositional traces	Any marks going through the patina; any traces of modern inference including cleaning, resharpening, reuse and breakage

native copper objects. However, similar manufacturing and use-wear did occur on the Lake Koshkonong material.

Manufacture and use-wear were discerned in the Koshkonong collections following Dolfini's (2010) guidelines and considering previous studies of prehistoric copper manufacture of Midwestern prehistoric objects. The layered appearance and rough surfaces on the majority of artifacts, especially fragments, indicated that the piece was manufactured using cold hammering during which the native copper was continuously folded upon itself and hammered flat with episodes of annealing (Figure 5). Striations were less defined on the Koshkonong collections than they were in Dolfini's (2010) study.

In addition to cold hammering, the distinct flat and mushroomed edges of some fragments imply that they were formed either by pressing the edges against a hard surface or possibly using a mold. The flattened edges did not have an irregular surface indicating that they were hammered, and one fragment had two adjacent flattened edges with a relatively clean corner, suggesting that the piece was pressed into a mold (Figure 6). Efforts were made to

**Figure 5. Fragments with layered structure and rough surface from cold hammered manufacturing.**

**Figure 6. Fragment with possible evidence for use of molds.**

discern use striations (deeper scratches occurring near edges or functional elements) versus manufacturing striations (numerous thin striations in the same direction throughout a larger portion of the object). Manufacturing striations often occurred across the entire body of beads, pendants, and the body of awls, indicating that this wear is probably a result of grinding the object into shape during manufacture or may have been unintentional wear from deposition or modern curation.

The “concave sides” that Dolfini (2010:1038) notes were present on the adzes in the collections and on many awls. This deformation may be the result of crushing pressure from cold hammering manufacture or from extensive use in prehistory. However, these concavities were often clearly defined on awls and may have been an intentional feature (Figure 7). Roughly half of the Koshkonong awls (53%, n=44) exhibited these depressions running along the center of one or more faces. The frequency of this *channeling* feature indicates that it either served a function or that it may form from a common use. Channels on copper spuds functioned as a hafting element and were attached to wooden handles in a variety of ways (Martin 1999; Roberts

**Figure 7. Channeling feature on awl body.**

and Ottaway 2003). However, the channels on the Oneota awls are shallow, usually less than a millimeter, and would not have effectively held a haft in place. If this was an intentional characteristic, it may have had a function other than hafting, such as holding string or dye. The channeling could also be a byproduct of manufacture or use. A significant portion of awls, 56.6% (n=47), have square cross sections at their center that were rounded into circular cross sections toward one or both ends. Pressure on the corners of the awl's square cross section either from manufacture or use could form these channels. The frequency of this feature calls for additional experimental studies in order to demonstrate whether it is a functional element or distortion from use.

#### Lake Koshkonong Manufacturing Techniques

Artifacts within the Lake Koshkonong collections exhibit rough, irregular surfaces and have layered appearances, signatures of cold hammered manufacturing. Almost half of the artifacts (55.2%, n=351) possess striations on their surface from probable grinding. The cleanliness of bead, pendant, and mace edges indicate that these pieces were cut out of a

prepared blank, probably with a stone tool. Some of these cut edges were additionally thinned after cutting, as seen on the outer, convex curves of the KCV serpentine pendant.

The layered appearance of awls and their rough surfaces indicate that they were manufactured by cold hammering the copper into a rectangular or cylindrical shape at their center with each end shaped either by grounding or additional hammering. Twenty-three awls (27.7%) are rounded in cross section, whereas 60 awls (72.2%) are squared or boxy. Squared cross sections became more rounded near one or both ends of the awl, with 40% of squared awls (n=24) having transverse striations across their rounded ends. These transverse striations could indicate that the awl ends were ground into rounded shapes, although they may also be the result of use. The variations in awl shape indicates different functions or manufacturing traditions.

Thirty-nine pendants (58.2%) included features presumably designed to adhering the object onto a piece of clothing or other material. The attachment apparatus of 56.7% of pendants (n=38) involve one to four punches. Only four pendants (6%) have a rolled over, tubular end that served as an attachment feature (Figure 8). Pendants with this feature are all serpentine in shape. A claw-shaped pendant from CAP also differs from the popular punched pendants, as it has an attachment element consisting of a notch on each side of the claw's base (Figure 9). Additional studies could investigate the diagnostic potential for varying attachment elements of the pendants, like those in the Lake Koshkonong collections.

The serpentine form of the blank used to create two beads from Crabapple Point, as well as the presence of distinct punches on these objects, suggest that these artifacts were created from repurposed fragmented pendants (Figure 10). Considering the average thickness of

**Figure 8. KCV serpentine pendant with rolled over attachment.**

pendants, 0.8 millimeters, and the number of fragmented pendants present in the Lake Koshkonong collections, 46.3% (n=31), pendants were fragile pieces prone to breakage. The ideological and social significance of native copper among the Oneota and the amount of labor

**Figure 9. Crabapple Point notched claw/talon pendant with possible notched attachment.**

**Figure 10. Bead from possibly repurposed pendant fragment.**

invested in obtaining and manufacturing copper may have warranted salvage and reuse of broken pendants whenever feasible.

#### Evidence for Variation in Manufacturing Methods

The similarity of manufacturing marks on the majority of artifact types hindered the ability to discern specific manufacturing traditions. However, within the range of manufacturing styles for beads in the Lake Koshkonong assemblages, there appears to be two clearly variant traditions. At one end of the spectrum, beads appear to be made haphazardly, with amorphous scraps folded into boxy beads, while another subgroup was meticulously crafted with clean cut edges, aligned seams, and rounded cross sections. One characteristic appears to be an indicator of these manufacturing styles. Beads of the haphazard technique have a small, pinched corner of the interior seam that juts into the orifice of the bead, whereas those with smoothed, unpinched interiors fall into the more laborious style (Figure 11).

**Figure 11. Example of bead with pinched interior seam feature.**

Splitting the beads into those with pinched interior seams (n=41) and those with smoothed interiors (n=244) revealed significant differences in the amount of labor invested in each type. Objects were classified subjectively based on their level of manufacture: no manufacture, some modification, crude manufacture, moderately refined manufacture, or refined manufacture. These categories were not intended to reflect an evolutionary development of techniques, rather they denote the amount of time and effort invested in the object. Bead manufacture could have become more refined over time, may have deteriorated as supply increased and mass production techniques were adopted, or could show the difference between novices and talented craftspeople. Comparing beads with pinched and unpinched interiors based on their level of manufacture, it appears that those with smooth interiors are more finely made (28.7%) than those with pinched interiors (4.9%) (Figure 12). Crudely manufactured beads comprised 48.8% of pinched beads compared to 15% of the unpinched assemblage. This resource expenditure is supported with more empirical evidence including the cleanness of the bead's edges, the roundness of its cross section, its physical dimensions, and attempts to hide the outer seam edge. Methods to disguise the seam included striations across the seam, incised

**Figure 12. Level of manufacture between beads with pinched and unpinched interiors.**

crimps, or adding material, possibly pitch or additional copper, over the seam and smoothing it against the body.

Whether the bead's edges were cut smoothly before or after rolling or if they were left uneven and jagged is one sign of labor investment. The care taken to thoughtfully prepare a blank into an even shape takes more planning and labor than simply flattening an amorphous blank. Pinched beads seem to have been made with less time investment, since only 41.5% of these beads (n=17) had clean edges compared to 73.8% of unpinched (n=180) (Figure 13).

The cross section of the bead is also indicative of the amount of time invested in its manufacture. While some beads are carefully rolled and rounded, others are boxy and, at times, appear to be blanks folded into triangular shapes. Comparing the proportion of rounded to boxy cross sections between the pinched and unpinched beads shows a stark contrast in the

**Figure 13. Shape of bead edges on pinched and unpinched beads.**

manufacturing techniques used on these two groups (Figure 14). The majority of pinched beads, 70.7% (n=29), have boxy cross sections, whereas most unpinched beads, 68.4% (n=167), are rounded.

Some previous studies have suggested that a bead's size is a diagnostic characteristic (Martin 1999). Applying unpaired t tests to the bead metrics shows that variation in the length, width, and orifice size between pinched and unpinched bead groups are statistically significant. Comparing the mean measurements of these dimensions demonstrates the differences between these groups (Figure 15). Pinched beads average 14.6 millimeters in length, whereas unpinched beads averaged 10.8 millimeters. This characteristic is the most statistically significant between the groups, as it has a P value of less than 0.0001. The average pinched width and orifice diameter are slightly larger than unpinched beads. Pinched beads have an average width of 6.2 millimeters with an average orifice of 3.9 millimeters, whereas unpinched beads average 5.8

**Figure 14. Comparing bead cross sections between pinched and unpinched groups.**

**Figure 15. Comparing bead measurement averages between pinched and unpinched beads.**

millimeters in width and 3.3 millimeters in orifice, roughly a 2.5 millimeter difference between the styles. These metrics are also statistically significant through unpaired t tests, as width and orifice comparisons between pinched and unpinched groups had a P value of 0.0498 and 0.001 respectively. The variation in this measurement is especially significant since it has the potential to indicate how the bead was formed. While larger, pinched beads could have been rolled by hand, smaller, unpinched beads may have required a mandrel to form tighter orifices (Ehrhardt 2009). Unlike the other measurements collected from beads in this assemblage, differences in the thickness of these objects did not seem to be statistically significant. The average bead thickness is 0.7 millimeters for pinched beads and 0.8 for unpinched, which translated to a P value of 0.0767.

While observing the 320 beads, difference in the treatment of seams became more apparent. Many beads showed that various techniques were implemented in an attempt to disguise the seam (Figure 16). Striations or incised crimps traversing the seam were often employed to tightly close and smooth this element. The most intricate technique observed among the Lake Koshkonong assemblages involved adding unidentifiable material next to the seam edge of the rolled over side and on top of the rolled under side. This material was smoothed into the body of the bead, sometimes hiding the seam entirely. This material ranges in color, and could possibly be black pitch or additional copper that has corroded into a teal color. Observing this technique in pinched and unpinched beads, only 7% (n=3) of the pinched beads have this added material, whereas 28.7% (n=70) of the unpinched beads showed signs of this technique. All pinched beads have intact seams and only two beads among the 320 had separated seams. Therefore, the added care invested in hiding seams through various methods was probably not for functional purposes since beads created with less labor did not frequently break or fall off

**Figure 16. Beads with disguised seams.**

garments/necklaces. If this laborious practice was not for functional purposes, it could indicate that, at some point in time or to some individuals among these Oneota groups, having a smoothed, apparently seamless bead was aesthetically pleasing and worth the added time investment. The precision of this manufacturing technique could indicate the ideological or social value of these adornments.

These two manufacturing styles indicate a variation in production strategies during the occupation of the Koshkonong sites. Pinched beads commonly exhibit irregular edges and boxy cross sections, are longer, wider, and thinner, and have a larger orifice. Unpinched beads show opposite characteristics. They mostly have clean edges and rounded cross sections, are shorter, less wide, and thicker, have smaller orifices, and about one-third show efforts to hide the seam (Table 3). Martin (1999:233) suggests that “[b]eads were produced from small prepared blanks or strips, which were then squeezed or tapped around a circular form to shape the bead. Others

**Table 3: Variation in manufacturing time investment and physical dimensions between pinched and unpinched beads.**

Characteristic	Pinched Beads (n=41)	Unpinched Beads (n=244)
Clean-Cut Edges	41.5% (n=17)	73.8% (n=180)
Rounded Cross Section	29.3% (n=12)	68.4% (n=167)
Attempts to Disguise Seam	7% (n=3)	28.7% (n=70)
Average Length (cm)	14.57	10.81
Average Width (cm)	6.17	5.77
Average Thickness (cm)	0.67	0.77
Average Orifice (cm)	3.89	3.24

were probably made round in a freehand method.” The pinched beads may have been quickly made by holding one corner of a prepared blank and rolling or folding it by hand, whereas the finer unpinched beads could have been made on a mandrel, which would have allowed for smaller orifices, rounder cross sections, and intricate seam work.

Comparing the interior treatment of beads across the Lake Koshkonong sites is limited due to the small number of beads originating from CBHC (n=1), KCV (n=3), and Schmeling (n=2). The interior seam of 11.25% (n=36) of the entire bead collection could not be observed either because of their form or extensive damage. These indeterminate beads include the only CBHC bead and one of the three KCV beads. Of this limited comparative data, 66.6% of the KCV beads have an observable pinched interior, whereas 76.8% of CAP beads (n=242) and all of beads from Schmeling have smooth interiors. Again, the few recovered beads from three of the four study sites inhibits the ability to draw definitive conclusions about differential manufacturing traditions between the sites. From the data present, it can be hypothesized that KCV subscribed to the more haphazard manufacturing tradition, which may originate from an earlier time or from less skilled craftspeople, whereas most CAP and Schmeling beads required more intensive labor. This discrepancy could suggest that these beads originate from different

points in time or were created by individuals from different households employing varying manufacturing strategies. Similarities between CAP and Schmeling beads also indicate that these sites may have had closer economic ties than they did with KCV, which is expected as KCV is farther inland and somewhat segregated from CAP and Schmeling. While the small sample size limits the reliability of this comparison, future studies of bead manufacturing could determine which manufacturing style was prevalent during specific time periods or at individual sites or regions.

Observations of manufacturing techniques across Oneota bead assemblages indicate differing production strategies across time or between individual producers. Whether the pinched and unpinched groupings are indicative of manufacturing traditions requires additional investigation and cross comparisons. Experimental studies could also reveal the manufacturing techniques used to create Oneota beads, especially those with a pinched interior seam corner.

### ***Function***

Determining use-wear on the copper artifacts of the Lake Koshkonong collections was also guided by Dolfini's (2010) distinctions, as well as Sievert Hohol's (1984a, 1984b) study of Old Copper awls. Bluntness, evidence for sharpening, bending, cracks, splaying, and striations probably not from manufacture were noted as use-wear. Following the suggestions of earlier use-wear studies, wear found on top of the artifact's patina was assumed to be from modern curation and handling (Dolfini 2011; Sievert Hohol 1984a, 1984b).

Beads and pendants in the Lake Koshkonong collections show some wear, indicating that they were worn or used. Of 320 beads and 67 pendants, 67.8% of beads (n=217) and 73.1% of pendants (n=49) have edges with nicks or other light wear, and four beads (1.3%) and 36

pendants (53.7%) are broken. The thinness of these objects, an average of 0.7 millimeters for beads and 0.8 millimeters for pendants, also make them prone to damage during use and after deposition.

The mace found at the Schmeling site also shows sign of use (Figure 27). The tip of the tapered end is slightly splayed and one corner of the flared edge is bent. A significant dent in the center of the flared edge and perpendicular striations and incisions indicate that this end may have been used for some light work. Smoothing and patina along the curvilinear sides also suggest that this object was extensively held. The wear on the mace demonstrates that this object was created for some sort of technical purpose and not strictly for political or ritual use.

Two adzes were found at the Lake Koshkonong sites, one from Schmeling and one from CBHC (Figure 17). Both edges of the two adzes show signs of wear. Squared ends bear evidence for battering including cracked and splayed portions and U-shaped dents with accompanying ripples. The ends of these adzes that are slightly thinned to a point exhibit polish. In addition to this end damage, the Schmeling adze has incised decorations on its body along with deep incisions roughly ten millimeters from its thinned edge and running perpendicularly. It is unclear if these incisions are from intense lateral movements or if they are intentional decorative or functional inclusions. Unlike the Schmeling adze, the center of the CBHC adze shows a diagonal impression and polish running across the body of the adze that is mirrored on each side. This wear could indicate that the CBHC adze was diagonally affixed to a haft, though the function of the adze in this position is currently unknown.

**Figure 17. The Schmeling adze (left) and the CBHC adze (right).**

### Awl Use

The assortment of awls exhibits the most observable variation in wear. Previous studies indicate that Archaic awls were used for “prying, drilling, chipping, and punching” (Martin 1999:229). While Archaic awls differ from Oneota by roughly 2,000 years, the majority of use-wear present on Oneota awls indicates that they were possibly used for similar purposes. Sharp bends near the center of 16.9% of awls (n=14) suggest they were used for prying since the center of the awl would have been stressed as the fulcrum if the awl was used as a lever. Transverse striations on 49.4% (n=41) of awl ends indicate a possible drilling function, whereas 45.8% (n=38) with nicks and cracks at their end may indicate chipping, and 12% of the Koshkonong awls (n=10) had s-bends nearer to one end suggesting their use for punching (Figure 18). The

**Figure 18. Examples of the range of use-wear on Lake Koshkonong awls.**

majority of awls (84.3%,  $n=70$ ) were probably multifunctional since both ends exhibit use-wear. The range of form and use-wear hint at a possible underlying functional typology that could be developed for Oneota awls through the accumulation of comparative data from other sites and ethnographic accounts.

Twenty-one awls included a thinner, flattened end. Nine of these awl ends (42.9%) exhibited nicks, polish, and perpendicular striations or incisions, which indicate a scraping function where the awl was pushed forward across a surface. Among awls of this type exhibiting this wear was a finely made awl with a clearly defined edge, shaped like a celt (Figure 19). In addition to possible scraping functions, six of these awls (28.6%) had striations or incisions running parallel to its edge implying use in a lateral motion. The specific task requiring lateral

**Figure 19. Examples of use-wear on flattened, rounded awl ends.**

movement of these flattened edges is currently unknown, but could have involved grinding pigments or scoring ceramics.

While previous studies have relied on the length of awls to distinguish function, the Lake Koshkonong collections do not always support this theory (Martin 1999). Similar forms with like damage are seen in varying sizes. For example, the awls shown in Figure 20 vary considerably in length, but have analogous shapes and use-wear. Large discrepancies in length could point to varying technical utility; however, more intensive use-wear analysis and typographical studies should be conducted to test these presumed functional types.

**Figure 20. Awls of varying sizes with similar shape and wear.**

### Awl Hafting

While copper awls have been found in wooden and bone handles within Midwestern archaeological contexts, the frequency and method of hafting is currently unknown. Brose (1970) previously suggested that awls were driven into the handle. Future experimental studies could specifically identify whether awls were hammered, pushed, or twisted into a handle by the damage that these processes inflict.

Ten awls (12%) within the Koshkonong collections have blunt, cylindrical ends conducive to hafting. Three awl ends with this shape exhibited polish, a possible byproduct from the awl rubbing against the haft during use. Transverse or diagonal striations also occur on four blunted awl ends, which indicate that they may have been twisted into their hafts (Figure 21). In

**Figure 21. Blunt, rounded awl ends conducive to hafting.**

one instance, an awl with a rounded, blunt end included a concretion that appears to be a type of adhesive used to secure the piece within a haft.

Penman (1977) argued that the wide center of numerous awl types could have been intended to hold the awl firmly in the haft. This strategy would leave focused use-wear at the center of the awl's length. The copper awl and beaver tooth composite tool found at the Riverside site (20ME1) during the 1960s, also indicates that a wider center could have been useful in hafting strategies (Hruska 1967; Martin 1999; Figure 22). Martin (1999:233) describes this hafting technique:

The haft was basically a handle with a cut out slot, with a deeper cut at the end of the slot proximal to the butt of the handle, which accommodated a ninety degree bend in the end of the awl. This hook shape end held the awl in place and prevented it from being

dislodged during use. The awl was pressed or driven into the slot, then the hollowed area was filled with a corresponding block of wood, glued and wrapped with rawhide.

Martin (1999) suggests that the 90-degree bend in the Riverside awl is an intentional feature to hold the awl in place, and that this feature is relatively common on Archaic awls. However, this distortion may also be an unintentional feature created when the awl shifts further into the shaft by a strong downward force, which is common in punching or drilling functions.

While none of the awls in the Koshkonong collection include an end with a 90-degree bend, 32.5% (n=27), almost one-third, showed a concentration of striations or polish at their longitudinal center. If these awls were hafted, these data support Penman's (1977) assertion that the central width of copper awls functioned to hold the tool in place within the handle. The prevalence of this central wear also could indicate a hafting technique similar to that found at Riverside, where a block of wood secured the awl in place. Shifting of the awl against this block during use would have created the concentration of central wear found on these Koshkonong awls. In addition to wear at their center, roughly three-quarters of these awls showed use-wear on both ends (74.1%, n=20), which included transverse striations, cracks, bends, and nicks. The interior end of hafted awls could obtain wear from the hafting process or by slight movements inside of the handle. Additionally, temporary hafting could be achieved with this method if a

**Figure 22. Dual beaver tooth and copper tool from the Riverside site (Hruska 1967: Figure 62).**

wooden shim was used without adhesive. This temporary haft would allow the user to rotate the copper insert and utilize both ends.

The use-wear on the copper of the Lake Koshkonong sites affirms many previous assumptions about their function, though more experimental work will be needed to identify the specific activities for which these tools were used. The small number of awls present at CBHC (n=2), KCV (n=1), and Schmeling (n=1) compared to the 79 awls found at CAP may also indicate that, although these artifacts were utilitarian, they were either used for only a specific activity or by certain individuals. The frequency of awls found at CAP could indicate that this special function was performed more frequently at CAP or that more individuals residing there had the ability to participate in this activity. The amount of copper present at CAP may also indicate these awls were used for copper manufacturing.

### ***Ornamentation and Decoration***

The profusion of copper personal adornments within the Koshkonong collections, 60.8% of the assemblages or 387 individual pieces, and the mythological symbols incorporated in pendants demonstrates a desire for individuals to personally associate themselves with this material. Considering the significance of symbols to the Oneota and Middle Mississippian world view and ethnographic accounts of leaders identified with copper ornamentation, the personal adornments recovered from the Lake Koshkonong sites probably had ideological and social functions among the Oneota societies of the area (Benn, 1989; Trevelyan 2004). When worn, these decorative pieces would recall powerful mythological entities and associate these beings with its wearer. This function follows the definition of ideological objects previously in this thesis. However, the small amount of copper found in burials questions this ideological function

(Foley Winkler 2011). Since Oneota burials rarely include burial goods, the relative absence of copper is not entirely surprising (Foley Winkler 2011). These items may also have been handed down as heirlooms instead of being interred with the deceased.

Decorations on these pieces consist of incisions created with a tool possibly made of stone, bone, or copper. This incising is often thin and somewhat shallow, but is visibly distinct from the lighter striations occurring on the surface. Ornamental etchings appear on a variety of copper items within the Koshkonong collections. The copper mace, the adze from the Schmeling site, and 21 pendants (32.3%) are decorated with incising. Additionally, 22.5% of beads (n=73) are incised, including one with a clear curvilinear design (Figure 23). A popular design on these copper materials is a crosshatched motif, which appears on seven beads, 16 pendants, one adze, and the Schmeling mace.

**Figure 23. Bead with incised swirl design.**

### The Incised Pendant of Crabapple Point

One circular pendant in the CAP assemblage included elaborate iconographic designs. Fifteen carefully incised crosshatched triangles border the pendant, and more imprecise incisions appear at its center (Figure 24). These central incisions possibly include a horned figure with two eyes, rays radiating out from the triangular border, a more significant triangular shape near the bottom of the pendant, and erratic incisions. Interpretations of these incisions are difficult, especially because of their uniqueness in the currently known Oneota iconographic repertoire. The border of 15 crosshatched triangles may represent specific geographic locations, events in time, or regional tribes, or they may be a symbolic representation of an inanimate object, such as a net (Figure 25; Lothson 1976). Similar incised triangular borders have also been observed on SECC plate rims (Figure 25, Smith et al. 2004). The cleanliness of this border seems disjointed from the inner incisions, possibly indicating that these were inscribed at different times. A portion of the inner designs slightly resembles possible Red Horn depictions found on petroglyphs at the Harvey Rock Shelter in Minnesota and at the Late Prehistoric Indian Cave site (13AM84) in Allamakee County, Iowa (Benn 1995; L. Stanley 1993; Lothson 1976; Winchell 1911; Figure 26). Red Horn, or He-Who-Wears-Human-Heads-As-Earrings, appears in rock art as early as A.D. 900-1000 and persists into historic Native American ideology (Benn 1995). The presence of this shared iconographic symbol across numerous geographic localities suggests that these regional groups possibly shared ideologies or group identities and were in contact with one another during the Late Prehistoric period.

**Figure 24. Incised pendant from Crabapple Point and line drawing of incised design visible on one side of the pendant.**

**Figure 25.** Crabapple Point pendant border element with net figure from the Jeffers Petroglyph site in Minnesota (center) and SECC ceramic decorations from Tennessee (right) (Lothson 1976:Figure 30; Smith et al. 2004:Figures 7 and 8).

**Figure 26.** Crabapple Point pendant central incisions and potential Red Horn figures found at Harvey Rock Shelter in Minnesota and Indian Cave in Iowa (Benn 1989, 1999; Lothson 1976:Figure 43; D. Stanley 1993:Figure B20; Winchell 1911: Plate 11).

### Maces at Lake Koshkonong

Among the copper recovered from the Schmeling site is an item similar to those classified as maces (Figure 27). It is a sizable copper object measuring 61.5 by 28.8 millimeters and weighing 11.4 grams. The surface of the Schmeling mace has crosshatched designs incised across the body on both sides and could indicate that this piece had an ideological function, though slight damage along its wider edge and thick polish covering the majority of the object may suggest additional technical uses.

The shape of this mace differs from other mace pendants found at the site, as it does not have smaller, clearly defined side points (Giles and Knapp 2015). Mace symbols are common throughout Eastern Woodlands ideology. Hall (1997) describes the reoccurrence of this symbol in prehistoric groups, such as the Oneota, and historic tribes, as well as the power behind this symbol and its links to prestige within a community. He indicates that the mace symbol “was a

**Figure 27. The Schmeling mace.**

relic of the form of the twin-fingerloop atlatl, and the atlatl itself was a cosmic symbol that symbolized the earth and the path of the sun across the earth” (Hall 1997:112). Additionally, he mentions that the mace symbol was used among female members of “a society of honorary chieftainship” among the Omaha tribe to denote members who have achieved numerous honorary achievements (Hall 1997:111). After a woman completed 100 honorary tasks of charitable and moral deeds, that they were allowed to dance at the meetings of this special chiefly group, which symbolized feminine force and the Night (Hall 1997).

Mace symbols are also one of the definitive icons of Middle Mississippian ideology. This symbol is considered to hold great ideological significance, which some attribute to an affiliation with the sun or the sacred fire and its frequent combination of upper- and lower-world attributes (Cobb and Giles 2009; Giles and Knapp 2015:83; Van Horne 1993). Researchers have also suggested that this symbol was an icon associated with a specific high-ranking military role (Giles and Knapp 2015; Jolly and Scriver 1974).

The Schmeling mace has a form similar to Type I in Brown’s (1996) typology of Mississippian maces. This mace type has a wide, semicircular crown, rounded side points, and a long shaft (Figure 28). Giles and Knapp (2015) recently used this typology to classify a chert mace originating from Nichols, New York, and determined that their mace conformed to Brown’s (1996) Type I. Utilizing radiocarbon dates from sites providing Type I maces, Giles and Knapp (2015) concluded that the Nichols mace and others of this type were manufactured between A.D. 1200 and 1400. This temporal range provides a reasonable date for the Schmeling mace, since it coincides with the Oneota occupation of the Lake Koshkonong region.

**Figure 28. Mace anatomy (Giles and Knapp 2015:Figure 7).**

The eight mace pendants recovered from CAP also fit a Type I classification (Figure 29). These pendants match the description of *copper symbol badges* that Waring and Holder (1945) mention in their inventory of artifacts from various Mississippian sites, including Etowah, Moundville, and Spiro. They describe these badges as “small, sheet-copper bangles pierced for suspension” (Waring and Holder 1945:9). Hill (1962:144) mentioned the presence of these mace-shaped ornaments at Oneota sites of Wisconsin, especially those of the Grand River Focus, and dates their presence in Wisconsin to roughly A.D. 1250. The proliferation of mace symbol badges at Moundville led Webb and DeJarnette (1942) to suggest that this site manufactured and traded them throughout the Eastern Woodlands, although their data predates the recovery of numerous badges throughout the eastern United States.

The manner in which these symbols developed in the ideological vernacular of the Koshkonong Oneota is unknown. The presence of the mace symbol at the Schmeling site and additional Type I maces within the pendant assemblage of CAP could demonstrate that Oneota groups living in the Lake Koshkonong region were interacting with Middle Mississippian sites

**Figure 29. A selection of mace pendants from Crabapple Point with mace types (Giles and Knapp 2015:Figure 6, red box and insert added)**

during the time of Type I mace popularity, A.D. 1200 to 1400. It is also likely that this shared symbol indicates common ancestry between the Oneota and Middle Mississippians. These ancestral ties are supported by the belief that mace symbolism is a carryover from earlier atlatl technology, which would explain the independent development of this symbol among various groups who previously utilized atlatls (Hall 1997). It is also possible that the mace originates with either the Oneota or Mississippians and was disseminated to the other via an exchange of ceremonial objects between ethnic groups, since this practice was often part of political interactions (Giles and Knapp 2015). Since the mace has been argued to denote individuals in military position, mace pendants could have been captured during warfare (Giles and Knapp 2015; Jolly and Scriver 1974). Additionally, the mace symbols could support claims in the

ongoing debate of Oneota origins, which argues that the culture is an amalgamation of Middle Mississippian and Woodland cultures. However, these mace objects date to post A.D. 1200, the later portion of the Early Oneota period. Future sourcing studies could illuminate the origins of pendants bearing mace symbols, and indicate whether these objects were created locally or if they were traded to the Koshkonong area from a Mississippian site.

### Adzes

Two copper adzes appear in the Koshkonong collections, one from Schmeling and one from CBHC (Figure 17). The CBHC adze has numerous incisions on its surface. Throughout its body are crosshatched designs, and there are distinct incisions across both sides of the pointed end, roughly ten millimeters from the edge. While the crosshatching on the body of the adze appears to be a deliberate design, the intentionality of the incised end is questionable. If the incisions are a result of use, their depth and distance from the edge are a unique type of use-wear not observed on other artifacts in the collection. To achieve the depth of these incisions, the adze would need to have been intensely used in a lateral motion, which seems unlikely since the polish and asymmetry on this sharpened edge suggests a cutting or axing function. The lack of decoration on the Schmeling adze also raises questions about the specific functions and potential social or ideological roles that this object type may have held.

### A Regional Identity

Similar to historic tribes of the Midwest, such as the Ho-Chunk, individual Oneota clans or regional parties may have identified with one of the cosmic realms in their dualistic ideological framework (Benn 1989; Lillie and Schermer 2015; Radin 1970 [1923]). The

pendants of the Lake Koshkonong collection have been described by others as symbol badges either worn on an article of clothing, in an individual's hair, or integrated into a headdress (Giles and Knapp 2015; Hall 1962; Jolly and Scrivner 1974, Waring and Holder 1945; Webb and DeJarnette 1942). When an article is integrated into an individual's regalia, it also becomes a part of the performance of that individual's or group's identity (Earle 1997; Hansen 2004; Inomata and Coben 2006). The frequency of personal adornments within the study collections suggests that copper was an important aspect of the regional identity of the Koshkonong Oneota.

Investigating the distribution of iconographic depictions has not been rigorously applied to Oneota copper artifacts, and the few iconographic pieces present at three of the four sites within this study allow limited local applications of this method here. However, Schneider (2015) argued that the Koshkonong locality may have identified with the upper world due to its location between two lower world localities: Grand River and Waupaca. Serpentine and triangular shapes, as well as crosshatching designs, were previously only observed on ceramics of the Waupaca and Grand River localities; however, these three symbols are present among the Koshkonong copper pendants (Schneider 2015) (Figure 30; Table 4). Claw/talon, mace, lunate, shield-like, and heartline symbols were not observed in Schneider's (2015) study. Adding the copper decorative motifs of this project to Schneider's (2012) observations increases the variation of the symbolic vernacular of the Koshkonong Oneota (Figure 31).

Schneider's (2015:337) argument that Koshkonong groups may have identified with the upper world is supported by the presence of claw/talon symbols related to the Thunderbirds of the upper world. However, the overwhelming majority of serpentine pendants and the presence of this symbol at each Koshkonong site argue for a closer affinity to the lower world, since the serpentine shape has been attributed to lower world snake deities, the copper tail of the water

**Figure 30. A selection of pendants from the Jim Bussey Crabapple Point collection.**

**Table 4: Number of appearances of symbols found among the Lake Koshkonong Collections**

Symbol	CAP	CBHC	KCV	Schmeling
Serpentine	26	2	1	2
Serpentine with bumps at end opposite attachment	2	0	0	0
Serpentine with mirrored sides (cloud-like)	4	0	0	0
Mace	8	0	0	1
Heartline	4	0	0	0
Claw/Talon	3	0	0	0
Circular	3	0	0	0
Shield-like	3	0	0	0
Lunate	1	0	0	0
Triangular	0	0	0	1
Crosshatching	23	2	0	1

panther, or could refer generally to the lower world's water spirits (Benn 1989; Ehrhardt 2009; Martin 1999; Radin 1970 [1923]; Trevelyan 2004). Though the Koshkonong groups may have associated their group identity with the lower world, the presence of upper world symbols and motifs shared with Middle Mississippian symbols indicate that their identity was fluid, and that the Oneota of southeastern Wisconsin were not secluded from other Oneota and Mississippian groups. Jeske (1998) and Peregrine (1995) suggest that the Oneota were, in fact, part of the Mississippian World System, and that they interacted with Mississippian groups on a variety of levels. These interactions included trade in utilitarian, ritual, and subsistence goods, as well as exchange of ideas, political interactions, and warfare (Emerson 1999; Gibbon 1995; Jeske 1998; Jeske et al. 2016; Karsten 2015; Peregrine 1995; Schneider 2015; Stoltman 1986; Strezewski 2006). While the Oneota cannot be described as subscribing to the exact culture and religion as Middle Mississippian groups, such as those residing at Cahokia, it is evident through these shared ideological symbols that they were connected to these groups and shared similar world views. Whether this world view originated at a Mississippian site, among Oneota groups, or was developed by earlier cultures is left to future research.

**Figure 31. Using symbols present in the Koshkonong Locality copper assemblages to update Schneider's (2015:Figure 5.40, red marking and fading added) ceramic data, which compares iconography at three Oneota regions in Eastern Wisconsin.**

## CHAPTER 5: DISCUSSION

The analysis of the Lake Koshkonong copper collections provides insight on the four primary questions of this project that were outlined in the introductory chapter. It is worth repeating here that the various recovery methods used to collect this material (professional excavation, surface collecting by a private collector, and metal detecting) creates a sampling bias with the copper recovered from each site. While metal detecting can recover almost 100% of the copper material from the site, professional excavations only reveal a fraction of the site assemblage. A significant portion of CBHC has been surveyed and excavated, which lessens this discrepancy; however, the ability to accurately compare the collections is still hindered. For the sake of this thesis, the representativeness of these collections is compared, but the conclusions drawn from these analyses are more hypotheses than firm conclusions. Additional excavations at CBHC, KCV, and Schmeling may reveal additional copper artifacts, in which case the results of this study will need to be reassessed.

### ***Question 1: Distribution***

*Are the artifact types equally present at each site? What might this imply about the social relationships between the sites?*

The benefit of using copper collections from a cluster of four sites is the ability to investigate differential access to resources and to hypothesize about social interactions among these villages. The variation in copper among the sites point to possible social interactions between the Oneota groups who occupied them. Considering the large discrepancy between the Lake Koshkonong sites and the density of copper found at CAP (91.7% in number and 67.1% in weight of the total copper artifacts found among these four sites), it appears that CBHC, KVC,

and Schmeling had restricted access to copper; whereas copper was more readily available to individuals residing at CAP. Again, the variation in collection techniques must be considered in this difference. Mr. Bussey's extensive collecting with a metal detector at CAP skews this data. Despite this difference in recovery method, the large differences in copper densities between the sites warrants further discussion.

While some copper among the collections could have been obtained and manufactured by local individuals, these artifacts may have been obtained through trade. A lack of excavated data from the Oneota components at CAP hinders interpretations of differential access to copper among the site's residents, but the abundance of copper at this location suggests that this material was an important aspect of the overall group identity. One or more residents of CAP may have held certain social or ideological privileges that gave them the power to accumulate and redistribute copper goods. The small amount of copper material recovered at the other three sites could suggest that those at CAP may have only traded copper to influential individuals or heads of households at nearby sites. Although CAP objects lack detailed provenience information, copper items recovered from CBHC and KCV are known to originate from domestic contexts. Disposal of these items in refuse pits may counter the argument that copper had significant ideological importance to the Lake Koshkonong Oneota; however, one of these pits also included a human maxilla and bear canine. Isolated human remains have been found in Oneota pits, and these depositional contexts do not necessarily denote a ritual function to pit features.

Considering the distribution of ideological symbols more broadly, the shared motifs between Oneota groups of Wisconsin and other Mississippian groups indicate that these cultures were part of the same world system (Jeske 1998; Schneider 2015). The serpentine pendants found at each of the sites could represent regional identity. Adornments depicting this shared

identity may have been reserved for individuals with achieved status in their community (Mann 1982; Peregrine 1995). Conversely, the unique symbols found at the Lake Koshkonong sites speak to the distinct group identity of this Oneota locality. While residents of the area may have encountered and adopted some symbols from other localities or from Middle Mississippians through various types of interactions, their choice to embrace, ignore, or actively dispel certain motifs speaks to the nature of these social relations, their personal and group identity, and their world view.

Placing the dense copper collections from the Oneota component at CAP within the greater history of the area shows a prolonged tradition of metalworking in the area. Along the northwest shore of Lake Koshkonong, it appears that Carcajou Point had a tradition of copper working during the Archaic period and CAP has evidence for copper manufacturing in prehistoric times and lead processing during the historic component (Ahlrichs 2016; Birmingham 2011; Hall 1962; Hill and Jeske 2011; J. Bussey, personal communication; Spector 1975, 1977). The continuity of metalworking at this location indicates a possible ideological connection between this material type and the physical setting of the sites.

The significance of this place, visible through the continuity of a shared specialized activity throughout time, may indicate that the northwestern shores of Lake Koshkonong functioned as a *conceptualized landscape* to its various prehistoric and historic occupants. Knapp and Ashmore (1999:11) define this type of social landscape as being “characterized by powerful religious, artistic or other cultural meanings invested in natural features rather than in material culture of monuments.” The natural setting of these sites may have been associated with an ideological concept related to metalworking practices. Since “[l]andscape is often regarded as the materialization of memory, fixing social and individual histories in space” and that this “memory

stresses continuity in the landscape,” this conceptualized landscape may have perpetuated throughout time as part of the social memory of various groups who occupied the area (Knapp and Ashmore 1999:13-14). Social memory has been defined as “the selective preservation, construction, and obliteration of ideas about the way things were in the past, in service of some interest in the present” (Van Dyke 2011:237). Establishing and sustaining social memory of landscapes can function to strengthen social identity, which “draw[s] together groups of people with real or imagined common pasts” (Van Dyke 2011:237). If the Lake Koshkonong tradition of metal working in the Archaic was continued by groups who occupied the area because of potential shared oral histories that associated peoples of the past with metal working activities, then the continuity of metal production in this area could be evidence of the importance of this landscape in Native American’s shared social memory and group identity. If Oneota and other Late Prehistoric groups personally identified specific locations with their social identity, then this notion could help explain the apparent territoriality of these groups (cf. Emerson 1999; Foley Winkler 2011; Jeske 1990, 2000; Richards and Jeske 2002; Schneider 2015).

### ***Question 2: Manufacturing***

*What manufacturing techniques were used to create these copper artifacts? Can manufacturing traditions be ascertained among/between the sites?*

Evidence of manufacturing on the Koshkonong copper artifacts indicates that these Oneota groups were using cold hammering to flatten pieces of native copper and folding it upon itself during this cold hammering process to create more homogenous pieces. Flattened, layered appearances of numerous copper artifacts and of the fragments in the collection testify to this method. Additionally, striations running throughout the body of numerous artifact types,

including beads, pendants, and awls, could be the result of grinding hammered pieces of copper to create thinner pieces with smoother surfaces. Cleanly cut edges of the pendant collections and the incisions appearing along the edges of fragments indicate that flattened pieces were cut into shapes, probably using a sharp lithic utensil. Some artifact types were rolled, possibly with the assistance of a mandrel, others were punched from one direction, and numerous pieces had decorative incisions engraved onto their surface.

Unworked or partially worked fragments appear at each of the Koshkonong sites, especially at Schmeling, suggesting that some copper artifacts could have been manufactured locally. The large flattened fragment recovered from the Schmeling site could suggest that copper was traded as raw pieces or that large float copper was present among the glacial till surrounding the sites. Conversely, the presence of symbols shared with other Oneota localities and Mississippian groups indicates that the manufacture of these items could have been influenced through social interactions or that these items were being manufactured in the south and traded to the Koshkonong area. It is also possible that these items were created by the local Koshkonong Oneota to be used for trade or political interaction with these foreign groups.

While Spector (1975) indicated that historic metalworking at CAP was a specialized activity and that the site was not primarily used for habitation, Birmingham's (2011) study of the ceramics originating from the Oneota component demonstrates that this was not the case during the prehistoric occupation of the site. Judging by the amount of copper artifacts present at the site, especially fragmented pieces, extensive copper manufacturing was happening within the prehistoric Oneota village. Oneota copper production was probably a domestic activity instead of a specialized communal activity as lead processing was during the historic period (Benn 1989; Spector 1977).

The manufacturing of the beads found at Lake Koshkonong exhibit a range of refinement. At one end of the spectrum are beads that appear to be created with less refined methods. These beads are boxy, have irregular edges, and their seams are often askew. Another set of beads appears to have required intense labor, as they are neatly made with cleanly cut edges, aligned seams, and, sometimes, had their seams carefully disguised. The two subgroups of beads demonstrate varying investment of labor and significance of aesthetics. The cause of this divergence may be differing skills of the individual manufacturer, different production techniques between households, the presence of locally constructed and trade beads, or it could represent a change in the manufacture of these artifacts through time. It is possible that bead manufacture became quicker and less precise through time as demand increased, although the improvement of manufacturing techniques throughout time is a more likely explanation due to the small number of beads at CBHC, KCV, and Schmeling. If beads required little energy to make and, thus, were less valuable, a more even distribution would be expected that mirrors other everyday low value goods, such as scrapers. These refined techniques probably required more time and labor investment, which would have increased their value among Oneota groups.

The limited number of copper artifacts recovered from CBHC, KCV, and Schmeling hinder any definitive conclusions about variation of manufacturing practices between the sites. The data set developed from this study show that KCV had beads of the less-refined style and that the majority of beads from Schmeling and CAP were of the labor-intensive style. However, this conclusion is based on only a handful of artifacts from KCV and Schmeling. Additional studies of beads across time and space may illuminate whether manufacturing variation is significant enough to become a diagnostic feature of copper beads.

### ***Question 3: Use-Wear***

*What type of use-wear is present in each artifact category? Does this confirm or call into question the previous assumptions of their use?*

Use-wear observed in the study collections was mostly as expected. Personal adornments, such as beads and pendants, have light nicks and striations indicating that the objects functioned as personal ornaments and did not have any strenuous technical uses. More utilitarian pieces in the collection, especially awls, exhibit significant wear demonstrating their use as tools.

Small adzes, one from CBHC and one from Schmeling, also show significant signs of wear, but wear patterns appear to vary significantly. Buckling and edge damage on the Schmeling adze suggest it was intended for more extensive use. Wear near the center of this piece suggests that the adze was hafted diagonally. This unique hafting angle differs from observed adze hafting techniques and raises questions about the intended use of this tool. The amount of polish on the CBHC adze and the use-wear along each end suggest that the adze was used, but potential incised decorations throughout the body of the adze indicate that its function may have been more than strictly technical. The size of this adze, 62 millimeters in length and 11.6 millimeters in width, is rather small for strenuous work. Additional use-wear and comparative studies may illuminate the tasks for which these adzes were intended and explain their significant variation.

Similar forms and use-wear exhibited by awls from Lake Koshkonong suggest that a functional typology could be created based on additional use-wear investigations and comparative studies with other Oneota copper assemblages. Understanding the function of these tools could explain why 79 awls were recovered from CAP and only four were recovered from the other three sites of this project if this discrepancy is not due to differences in sampling

methods. If copper awls were intended for a common domestic function, such as punching leather or chipping lithics, a more even distribution of these tools would be expected. For example, it currently appears that all individuals punching leather at KCV would have to share the same awl. However, there are numerous bone awls from each of the Koshkonong sites, which may explain the variation in the presence of copper awls (Jeske et al. 2016). The potential variation between bone awl and copper awl functions requires additional experimental and use-wear studies.

Two alternative explanations could account for the discrepancy in copper awl appearance across the four sites: these tools were intended for a specific activity happening more frequently at CAP or the use of these objects were reserved for specific individuals at the site. The abundance of awls and other copper material at CAP could indicate that these tools were used for copper production, and that they may have been utilized to incise designs on the surface of copper artifacts or used to shape beads. Awls were probably not used as mandrels since their average width, 4.5 millimeters, is over a millimeter wider than the average bead width of 3.3 millimeters. These copper tools could also have been used for utilitarian purposes previously described by archaeologists, including punching leather or chipping stone, by an influential individual, possibly the head of a kin group or a religious figure.

While the use-wear observed on the awls and other artifacts in the collections match proposed functions for these artifact types, the specific intended function of these objects requires additional use-wear studies. The uneven distribution of awls among the sites calls into question a strictly utilitarian function often ascribed to these items. Additional studies investigating the distribution and use-wear on Oneota awls may illuminate their technical, social, and ideological functions.

#### ***Question 4: Ideology***

*What types of ideological symbols are present among the pendants? What might these suggest about Oneota ideology and the ideological function of these items?*

Numerous symbols appear throughout the Koshkonong collections. Although the specific meanings behind these symbols are not known, they demonstrate possible social interactions among the Koshkonong sites and with outside groups. Symbols present in the collections include curvilinear/serpentine designs, maces, heartlines, circular objects, claws or talons, shield-like shapes, lunate pieces, triangular and pyramidal objects, and crosshatching. Some of these symbols are unique to the Koshkonong sites; however, crosshatched and pyramidal/triangular designs have also been observed on Oneota ceramics from the Grand River locality (Schneider 2015). Each of the study sites yielded curvilinear/serpentine pendants, a symbol also observed at the Grand River and Waupaca localities. The appearance of serpentine symbols on the material culture of Oneota groups of various regions hints at the importance of this symbol for establishing a group identity both among clusters of sites and between regions. The numerous symbols unique to each region indicate that, while these Oneota localities may have interacted and even identified in some aspects with one another, these groups also were autonomous and had distinct local identities.

The presence of many of these symbols suggest possible broader connections with Middle Mississippians, and support Jeske's (1998) claim that Oneota groups were incorporated into the Mississippian world system. The exact nature of contact between these groups within this system is unknown; however, the amount of violence visible in the burials at CBHC may indicate that these copper items were booty from conflict or exchanged during peace treaties (Foley Winkler and Jeske 2003; Jeske et al. 2016; Schneider 2015). The evidence for copper

manufacture at the nearby Mississippian site of Aztalan could suggest economic ties between it and the Lake Koshkonong sites (Kelly 1991). Malnutrition of individuals buried at CBHC and the low quality raw material used for lithic production indicate the limitations of local resources available to the Koshkonong Oneota, and suggest that these groups depended on trade relations in order to obtain resources not in their immediate catchment area (Foley Winkler and Jeske 2003). Symbols shared among Mississippian groups and the Koshkonong sites indicate that the Oneota living in this area were either interacting with these outside groups in some form or, more likely, that the two groups share a common ancestor who had mace-like objects.

Mace symbols and other ideological motifs shared between Mississippian and Koshkonong Oneota material culture could also support the argument that the Oneota culture was a product of Middle Mississippian and Late Woodland interactions. Mr. Bussey's ceramic assemblages also originating from the Oneota component of CAP indicate a breadth of styles spanning the Late Woodland to late prehistory, and include a small number of Mississippian wares and one Allamakee Trilled sherd, possibly dating post A.D. 1400 (Birmingham 2011). The type of mace symbols present at the site; however, have been dated to A.D. 1200 to 1400, postdating the proposed emergence of Oneota lifeways by various researchers (Jeske et al. 2016; Schneider 2015; Overstreet 1997; Theler and Boszhardt 2006). However, the mace symbols observed in the study collections were more likely carried over from earlier prehistoric groups who utilized atlatl technology (Hall 1997).

Being the symbol of a significant social ranking, such as an accomplished warrior, the Schmeling mace could have been utilized by an individual with achieved social status who resided at the Schmeling site. Similarly, the mace pendants found at CAP could have been worn on an individual's clothes, hair, or in a headpiece to display status. Wearing these symbols of

influence would have also increased and reaffirmed an individual's social standing by signifying possible connections with foreign entities (Clark and Blake 1994; Earle 1997; Hansen 2004; Mann 1986; Peregrine 1995). While the meaning of these mace symbols and their specific social roles is not fully understood, additional excavations and research may provide a clearer picture of the implication of their presence.

Over half of the Lake Koshkonong collections consist of personal adornments including beads and pendants. Almost all of these ornaments, 373 artifacts (96.4%), originate from CAP. The amount of copper personal adornments from CAP indicates the social and ideological significance of this material. Wearing this material visually expressed that person's ability to acquire copper and the amount of social influence and relationships needed to obtain these manufactured goods (Mann 1986; Peregrine 1995). Considering the potential ideological significance of the raw material itself in the religious canon of the Oneota, wearing copper may have denoted an individual's relationship with divine figures and influence on the cosmos (Mann 1982; Peregrine 1995). Religious leaders, such as shamans, may have also used and worn copper since it was considered to have significant power.

Copper artifacts found at the Lake Koshkonong sites probably served multiple ideological functions. Regional symbols occurring on these objects may have been used to display one's cultural affiliation and regional alliances. Pieces bearing the symbols present in the study collection may have been gifted between the Koshkonong sites and among groups living within the Waupaca and Grand River localities. In addition to demonstrating a group's cultural identity, these valued items may also have functioned to denote an individual's status or social role. Finally, the ideological significance of copper and the symbols created with it suggests that

at least some of these items were used in ritual settings or by those with religious roles within Oneota societies.

## CHAPTER 6: CONCLUSION

This project was designed to investigate how Oneota groups living in the Lake Koshkonong region from A.D. 1100 to 1400 utilized copper. Observing the variation in bead manufacture throughout the Koshkonong collections indicates a variation in labor expenditure in bead types with one group requiring more energy investment, a common identifier for prestige goods within a society (Joyce 1998; Trigger 1990). All artifact types made of this raw material, including awls, appeared to have social significance. The few awls located at KCV, CBHC, and Schmeling compared to CAP's 79 awls indicates that this tool may have been used for a specific significant function or by certain individuals. Comparing the ideological symbols present among the copper collections to other Mississippian groups, indicates that the motifs used on the Koshkonong collections both established regional and possible ethnic identities, as well as functioned to display an individual's personal relationships with outside groups, such as individuals residing at Middle Mississippian sites. Overall, these lines of evidence suggest that copper was used by these groups as a prestige good, which established and continuously recreated social order and legitimized a higher social standing for select individuals residing among the Lake Koshkonong sites.

### *Theoretical Support for Koshkonong Copper as a Prestige Good*

Understanding the sociopolitical significance of prestige goods requires a discussion on the construction of value. Jeske (1992) and Trigger (1990) argue that humans must make conscious decisions about the allotment of their time and energy, since these are two finite resources that greatly impact manufacturing and subsistence activities. Individuals and groups develop strategies and technology to make some everyday tasks as energy efficient as possible.

Jeske (1992) demonstrates this practice through the economizing activities of Langford groups in northeastern Illinois who needed to efficiently construct lithic tools from local materials, since the violent social environment both restricted their access to raw materials and required higher energy investments in political activities, such as warfare and diplomacy. Conversely, other tasks are purposefully imbued with energy expenditure. Trigger (1990:124) describes this activity as *conspicuous consumption*, or “wasteful spending to enhance social prestige and power.” He argues that “political power is universally perceived as the ability to control energy,” and defines this mechanism further:

[...] if economy of effort is the basic principle governing the production and distribution of those goods which are necessary to sustain human life, the ability to expend energy, especially in the form of other people’s labour, in non-utilitarian ways is the most basic and universally understood symbol of power [Trigger 1990:125].

Considering the evidence for varied labor investment in the bead types of the Lake Koshkonong collections, it appears that there was motivation to expend energy on some beads for aesthetic purposes. This observation demonstrates the role in conspicuous consumption of individuals residing among the four sites of this study, especially at CAP. If the copper used to produce these Koshkonong artifacts originates from northeastern Wisconsin or if the pendants that bear symbols shared with other Oneota localities and Mississippian groups were obtained through trade, these artifacts would also have required significant energy expenditure since they had to be obtained through economic or political relations. The amount of time and energy spent

on procuring and manufacturing copper artifacts indicates its value to the Oneota communities of Lake Koshkonong.

According to Joyce (1998), value can also be constructed through a process she refers to as beautification. This process occurs when cultures begin to place more emphasis on the aesthetic beauty of objects. Joyce (1998) argues that this beautification creates and reinforces order. “Order,” she says, “originally flowed from persuasion and persuasiveness from beauty” (Joyce 1998:76). This persuasion is embodied in prestige goods that indicate an individual has expendable wealth and social connections. The increasing labor expended on increasing the aesthetics of beads at CAP, especially efforts to hide the seam edge, suggests a “high social significance of comparative evaluation of the appearance of people and their possessions, judgements that would have influenced the success of individuals and their social groups in contracting alliances with others” (Joyce 1998:69). By affiliating themselves with these copper personal adornments, especially those requiring connections with outside groups, individuals residing near Lake Koshkonong at this time could symbolize their control over labor and ability to expend substantial resources in order to obtain these pieces seen as valuable, beautiful prestige goods among Oneota groups.

Martin (1999) and Trevelyan (2004) have also identified the longevity of copper traditions in precontact Eastern Woodland groups. The continuity of copper procurement and usage in the Koshkonong area from Archaic to Historic times could be indicative of copper’s role in social memory and identity. Copper as an ideologically significant material was common among cultural groups of the Midwest throughout prehistory, and these longstanding traditions would have required leaders to act within this historical framework by exerting their control over

this symbolic material and displaying this ability through copper personal adornments (Martin 1999; Pauketat 2000; Trevelyan 2004; Van Dyke 2011).

Considering the abundance of copper prestige goods recovered from CAP, a kin group or individual with ascribed status or who was establishing the beginnings of social differentiation could have resided there and utilized copper to support their higher social status. The power to conspicuously consume prestige goods is created by the legitimization of one's power over others in the community. The development of copper as a prestige good probably did not occur instantaneously, but may have occurred gradually throughout time as one group slowly began to dominate copper procurement and manufacturing while others gave up ready access to copper not recognizing its potential role in legitimizing power and social order. Pauketat (2000) describes a similar phenomenon that occurred when mound building groups willingly constructed ideological architecture that would later be utilized to develop and affirm social inequality. As individuals at CAP obtained more control over copper goods, they could have used this ability to strengthen their claims of influence over other groups in the area.

Peregrine (1995:258) combines a World Systems approach with Mann's (1986) *Sources of Social Power* to assert that Oneota and Mississippian societies were "independent sociopolitical entities in constant interaction and reaction one against the other" and that their world system was "founded on and sustained by an economic interdependence." He defends the previous argument made by Brown et al. (1990), in which they demonstrate that this economic interdependence of groups within the Mississippian world system was based on prestige goods (Peregrine 1995). Publicly controlling and consuming a traditional prestige good like copper would have resulted in its user gaining the various types of power that Mann (1986) identified: ideological, economic, military, and political. Copper material culture originating from the

Koshkonong sites suggest that these materials were used to enhance their social power (Mann 1986).

According to Mann (1986) and Peregrine (1995), ideological power originates from the ability to control group ideology including ritual symbols, objects, and practices. Since copper had religious value among Oneota groups, publicly using and wearing this raw material may have demonstrated the ideological power of these individuals. Ritual symbols appearing throughout the Koshkonong pendants also may have demonstrated its wearer's control over group ideology simply through the ability to procure and publicly don these articles. While the serpentine motif is present within the Middle Mississippian canon, the occurrence of this symbol at each Koshkonong site and at both the Waupaca and Grand River localities suggest that this was a significant symbol among these groups, possibly tied to their ethnic identity (Schneider 2015). Symbols shared with Mississippian ideology, such as maces, were not present at each of the Koshkonong sites nor within each locality of Schneider's (2015) ceramic study, and could suggest that social interactions between CAP and these foreign groups were occurring in some capacity. The ability to display connections beyond the local community is often an integral aspect of legitimation of the social order (Clark and Blake 1994; Earle 1997; Hansen 2004; Mann 1986; Peregrine 1995). By restricting the flow of copper among the community and using this ideological material primarily for personal adornments, an individual or group with higher social status may have utilized this prestige good at the Koshkonong sites to legitimize their influence and reaffirm the social differentiation of the group.

Possessing and publicly displaying prestige goods also demonstrates an individual's economic power (Mann 1986; Peregrine 1995). Having the capability to procure raw copper, produce copper items, and exchange these objects locally and with foreign groups indicates an

individual's economic control over these prestige goods. While the exact sources of the copper among the Koshkonong collections require future compositional analyses, the amount of scrap copper found at CAP and Schmeling provide evidence for copper manufacturing among the Oneota groups who resided there. Additionally, the prolonged tradition of metalworking on the northwest shores of Lake Koshkonong throughout both prehistory and history suggest that the physical location of the sites had a tradition of metal economic activities.

The amount of mace symbols present at the Lake Koshkonong sites imply that the individuals who possessed these items may have had special military power. Mann (1986) identifies this power as stemming from a control over the group's military. Some studies have suggested that maces and mace pendants were used to denote individuals of significant military standing. (Giles and Knapp 2015; Jolly and Scrivner 1974). The potential associations between this symbol and this military role indicate that those who wore the mace pendants at CAP and the owner of the Schmeling mace may have held some achieved military power.

Lastly, Mann (1982) identifies political power as controlling the social interactions within a territory, which Peregrine (1995) models the Upper Mississippian political landscape with Theissen polygons. The Koshkonong sites are in close proximity; however, they appear to be secluded on the landscape from other Oneota localities (Jeske et al. 2016). This solitude may have restricted intense social interaction between Koshkonong residents and the Oneota of other localities, and may have only allowed small parties to venture across the landscape in order to interact with other groups. The ability to control these intergroup social interactions would have given political power to those select individuals allowed to participate in these excursions. Since the Koshkonong copper collections share stylistic and manufacturing techniques with the copper material culture of other regional groups, it is possible that some of these pieces were obtained

during these interactions either by trade, political ceremonies, or warfare. Potential redistribution of copper obtained through these interactions would have also reaffirmed the social order of the Koshkonong Oneota.

In sum, the copper artifacts of the Lake Koshkonong sites provide insight into Oneota lifeways. The density of copper at CAP indicates potential social inequality among the inhabitants of the four sites. Copper from CAP also provides evidence for a continued tradition of metal production at this location from prehistory into historic times. A closer look at bead manufacturing techniques shows a stark difference in invested labor between two subgroups of this artifact type. This dissonance in the importance of bead aesthetics demonstrates intensifying social and ideological significance of copper within Oneota groups and could imply the increasing importance of personal adornments. Additionally, observing use-wear on awls both affirms and adds to previous descriptions of how the Oneota used this tool type. However, their rare presence at CBHC, KCV, and Schmeling suggest they were either used for a specific restricted purpose or that they were owned by an influential individual. Finally, the ideological symbols present among the Koshkonong collections contribute to the developing narrative of Oneota identity and their belief system. These motifs show connections with other Oneota groups of the region and Mississippian groups to the south. Results of the study suggest that copper functioned as a prestige good that created and legitimized social order by enhancing the ideological, economic, military, and political power of particular individuals or groups.

## ***Future Research***

Besides answering the primary research question of this thesis, the secondary goal of this project was to experiment with prehistoric copper research methods in order to present their utility to the archaeological community. By thoroughly documenting copper assemblages, the resulting data elucidated aspects of Oneota copper manufacturing, utility, and value. Delving deeper, the information collected from these objects revealed aspects of Oneota social order, identity, ideology, economy, and political activities. With additional studies investigating copper distribution, manufacturing marks, use-wear, and the presence of ideological symbols, comparative studies may help to develop a broader picture of Oneota regional interactions.

## **Distribution Studies**

Comparative studies of copper distribution among Oneota sites would identify additional locations of manufacture, trade, and distribution. Future research could also test whether the Koshkonong sites are unique or if they follow a pattern of close-knit sites with a restricted flow of copper goods. Excavations of the Oneota component at CAP could further illuminate the nature of the apparent control of copper material by residents at the site, and whether they traded this material inland or if residents of the KCV, CBHC, and Schmeling sites obtained copper goods directly. These excavations could also explain the popularity of metalworking among both prehistoric and historic groups in the area.

Due to their recovery by amateur collectors, the majority of this study's sample has limited provenience information. This deficiency hinders comparative analyses of depositional contexts; therefore, copper found *in situ* should be a priority in subsequent studies. Despite this lack of provenience, these objects from private collections could be sourced using LA-ICP-MS

analyses in order to reveal the source of the copper of which they are composed. If these deposits are distant from Lake Koshkonong, then the acquisition of copper could have required significant energy expenditure, which would further support the argument that this raw material acted as a prestige good among the four Koshkonong sites. If the raw material appears to originate from sources in the southeastern United States, this information could illuminate previously unknown economic and social connections between Midwestern Oneota groups and Mississippian sites of the Southeast.

#### Manufacturing and Use-Wear Analyses

Although some North American archaeologists are skeptical of the utility of copper use-wear analysis, this study builds upon earlier research to argue that this method can be effectively applied to copper and that additional research is necessary to improve methods and create comparative data. Newly developed methods that allow us to observe the original surface of the artifacts, such as CT scans, can help to increase the efficiency of use-wear analysis of corroded artifacts. While 10x magnification was used for observing wear in this study, additional comparisons of the utility of higher magnification, such as those in the literature of lithic use-wear analysis, would be beneficial (Newcomer and Keeley 1979; Odell and Odell-Vereecken 1980). Establishing effective methods will require rigorous experimental archaeology in artifact manufacture, use-wear, and depositional damage. The manufacturing and use-wear present on the Lake Koshkonong collections were carefully documented and could be utilized for comparative data in future research efforts. The preliminary conclusions drawn from analysis of the study collection demonstrates the utility of this line of research, and hopefully encourages the utilization of this method in future analyses of North American copper artifacts. Use-wear

analyses may also reveal previously unanticipated functions of artifact types, especially awls. Additional investigations will aid in determining which signs of wear are definitively from manufacture, use, curation, and deposition.

### Ideological Studies

Ideological studies of prehistoric cultures are difficult, and therefore are often avoided in archaeological analyses. Despite the challenges posed by this line of study, ideology is an integral aspect to understanding Oneota groups since it was a fundamental aspect of their lives and dictated many of their activities. Lori Stanley (1993:122) argues that:

[...] as cultural anthropologists of the past, archaeologists are obligated to *attempt* to reconstruct ancient belief systems just as they reconstruct settlement patterns and subsistence systems. Perhaps the undertaking is the most complex and challenging one of all, but it is worth the effort if in the long run we are able to breathe some life into the often sterile, impersonal portraits we paint of the past.

Comparing ideological symbols found within various Oneota assemblages could lead to deeper understandings of Oneota identity, social and political interactions, origins, and possible historic connections. Additional studies identifying the spread of mace and claw symbols may shed light on Oneota origins as well as trade and political alliances. Understanding the context of these symbols and their potential uses through additional excavations, comparative analyses, and iconographic studies may further illuminate the Oneota world view and their social interactions.

By building upon previous studies to establish a defined methodology for prehistoric copper analysis, new conclusions and hypotheses can emerge. Not only are the functions of copper within Oneota societies more clearly defined by investigating artifacts of this raw material, but a broader understanding of Oneota identity, social and political interactions, ideological beliefs, and manufacturing traditions can be realized. This project hopes to contribute to the development of these analytical methods, as well as inspire future research focusing on Oneota copper.

## APPENDIX A: ARTIFACT FORM FOR DATA COLLECTION

The form below was populated from the Excel database using Word's mail merge feature. Forms were customized for each artifact type to reflect the individualized columns created for each type; below is a sample of the bead form. Accompanying catalog data will be an image of one or more of the object's size to scale. This document has information common to other copper studies including Rob Ahlrich's research of Mr. Bussey's Archaic copper collections from the Lake Koshkonong region.

**APPENDIX B:  
CODING SCHEMA FOR EXCEL DOCUMENTATION**

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Assigned Catalog Number	Unique identifying number given to each artifact	Coded	<ul style="list-style-type: none"> <li>• Alphanumeric designation</li> <li>• Letter: <ul style="list-style-type: none"> <li>◦ C = Crescent Bay</li> <li>◦ K = Koshkonong Creek Village</li> <li>◦ S = Schmeling</li> <li>◦ B = Ladd's Field / Bussey Collection</li> </ul> </li> <li>• Bussey Collection: Tray number will be noted after letter</li> <li>• Entries with multiple parts: Each part will be given a letter suffix and documented separately</li> <li>• Sample entry: B72-1A – From Crabapple Point, first object in Bussey's Tray 72, one part of Object #1</li> </ul>	Artifact
Reported Provenience	Site name and specific location (if known)	Narrative	Details of the artifact's provenience will be documented	Reported Provenience
Morphofunctional Designation	Assignment to a broad morphofunctional category	Coded	<ul style="list-style-type: none"> <li>• 0 = awl</li> <li>• 1 = bead</li> <li>• 2 = pendant</li> <li>• 3 = fragment</li> <li>• 4 = tinkler cone</li> <li>• 5 = other <ul style="list-style-type: none"> <li>◦ If 5 is used, a description of the object will be included in the comments of the entry</li> </ul> </li> </ul>	Morphofunctional Designation
<b>Patina/Corrosion Section</b>				
Patina Type A	Seafoam green in color (Munsell 2.5G 9/6, very light yellowish green)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina
Patina Type B	Vibrant teal in color (Munsell GLEY1 3/5, very dark grayish green), usually thicker, and more lustrous	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Patina Type C	Dark red/brown (Munsell 2.5YR 3/4, dark reddish brown)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina
Patina Type D	Dark brown/black (Munsell 7.5YR 2/5, black), usually thicker	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina
Patina Type E	Rusty yellow color (Munsell 5YR 5/8, yellowish red)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina
Accretions Present	Accretions are the “accumulation of extraneous materials on the surface [of an object]” (Motley 2010:70)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina
Pitting Present	“Small, irregular, shallow, pinhole-sized losses scattered over the surface of metal, caused by acidic conditions or resulting from the casting process” (Motley 2010:71)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina
% of Total Surface Area with Patina/Corrosion	The percent of the total surface area of the object covered by patina and/or corrosion was documented, but appears to be 100% for all objects	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present on 1-25% of object</li> <li>• 2 = present on 26-50% of object</li> <li>• 3 = present on 51-75% of object</li> <li>• 4 = present on 76-100% of object</li> </ul>	Patina
Location of Patina/Corrosion	Overview of major patina and corrosion on object	Narrative	Narrative will include most prevalent patina	Patina

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Use-Wear Section				
Stress Damage: Mushrooming / Splaying	“Mushrooming or splaying of edges was taken to be indicative of battering. For example, if a tool was used as a wedge, mushrooming would be expected on both proximal and distal ends. Smashing or bending back of edges could indicate pressure stresses” (Sievert Hohol 1984:18)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Stress Damage: Cracking	“Cracking may occur as a result of stress applied to anneal sutures. Cracking could occur also from environmental, or freeze/thaw stress. Fracture could result from excessive stress during use” (Sievert Hohol 1984:18)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Stress Damage: Bending	“Bending may result from excess pressure being applied to the tool against an unyielding worked material. Bending would occur more often to thin elements or elements held obliquely to the point of pressure. Bending might also occur at junctions of structurally weaker elements [...]” (Sievert Hohol 1984:18)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Striations	“The softness of copper makes it prone to striation resulting from use, manufacturing techniques or weathering” (Sievert Hohol 1984:18)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Incisions	Incisions differ from striations by penetrating deeper into the object's surface, and may be decorative elements. This term also has an implication of intentionality. Where striations are byproducts from manufacture methods or wear, the depth and placement of incisions indicate that the manufacturer intended for them to be seen in the final product	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Smoothing: Pre-Use	"Smoothing or polishing of the edges" from "extended use which would buff areas to a polish" (Sievert Hohol 1984:19)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Smoothing: Use	"Smoothing or polishing of the edges" from "intentional pre-use polishing by the manufacturer" (Sievert Hohol 1984:19)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Smoothing: Incidental	"Smoothing or polishing of the edges" that is incidental and "could occur through handling or friction against haft or bindings. Hand held tools might become polished from repeat handling." (Sievert Hohol 1984:19)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Loss: Broken Piece	Fragmented objects, such as those that have previously broken in half	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Loss: Nicks	Artifacts with small missing pieces, such as a bead with a portion missing from their edges due to extended use	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Retooling: Resharpened	“Resharpening is indicated if edges are found to have overlapping layers of beveling striation. [...] Resharpening is also suggested when, in pieces for which edge striations are absent, the edges show thinning (Penman, 1977). Also, morphological changes such as systematic straightening out of convex edges can result from repeated re-sharpening” (Sievert Hohol 1984:19)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Retooling: Repaired	Sievert Hohol (1984:20) assumes “that the most common would be the hammering straight of bends or twists in the metal that result from use. [She expects] that stress marks of some type would betray the presence of repaired bending	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Recent: Cleaned	Damage from contemporary artifact curation. “Cleaning or removal of patination from an artifact by means of abrasives can disrupt traces of striations or polishes resulting from prehistoric use or manufacture” (Sievert Hohol 1984:23)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Recent: Reuse	Damage from recent use. “Due to the similarity of [prehistoric] tools to many kinds of modern tools [...] some artifacts may have been utilized post-discovery” (Sievert Hohol 1984:23-24)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Recent: Curation	Damage from contemporary artifact storage. "Methods of curation could also affect the artifact. For example, two awls show a similar pattern. At approximately 2-3cm from each end there are transverse striations which appear to be recent since they cut deeply into the natural patina. These could only have been caused by thin wires having been used to hold the piece, most likely for display purposes" (Sievert Hohol 1984:24)	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Evidences of Use-Wear
Description of Use-wear Amount / Location	Information about the use-wear of objects not covered in other coded columns	Narrative	A description of the amount and location of use-wear.	Evidences of Use-Wear
<b>Manufacture Section</b>				
Level of Manufacture	Based off of observations, this cell evaluates the level manufacturing or the stage of manufacture that this artifact exhibits	Coded	<ul style="list-style-type: none"> <li>• 0 = unmodified</li> <li>• 1 = some modification</li> <li>• 2 = prepared blank</li> <li>• 3 = roughly manufactured artifact</li> <li>• 4 = moderately refined manufactured artifact</li> <li>• 5 = finely manufactured artifact</li> <li>• 6 = manufactured artifact probably significantly distorted after manufacture</li> </ul>	Manufacturing Stage/Process
Possible Manufacturing Method	Based off of observations, this cell suggests the manufacturing technique implemented to create the object or the blank to make the object	Coded	<ul style="list-style-type: none"> <li>• 0 = indistinguishable or N/A</li> <li>• 1 = folded over and cold hammered</li> <li>• 2 = possibly cut from copper or brass kettle</li> </ul>	Manufacturing Stage/Process

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Possible Shaping Method	Based off of observations, this cell suggests the shaping technique implemented to form the final shape of the object	Coded	<ul style="list-style-type: none"> <li>• 0 = indistinguishable or N/A</li> <li>• 1 = cut from blank and rolled, smooth</li> <li>• 2 = cut from blank and rolled, boxy</li> <li>• 3 = folded</li> <li>• 4 = cut from blank</li> <li>• 5 = cut from blank and punched</li> <li>• 6 = punched</li> <li>• 7 = hammered</li> <li>• 8 = ground</li> <li>• 9 = other               <ul style="list-style-type: none"> <li>◦ If 9 is used, a description of object will be included in the comments section of the entry</li> </ul> </li> </ul>	Manufacturing Stage/Process
Decorations Present	A note on whether decorations are present	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = possibly present</li> <li>• 2 = present</li> </ul>	Manufacturing Stage/Process
Decoration Description	If decorations were added to the formed object (e.g. decorative incisions were placed on a bead but not the decorative nature of the bead form/function itself), a description of these decorative elements will be noted here	Narrative	Description of what type of decoration and where it is located on the object.	Manufacturing Stage/Process
Cross Section Shape	A general description of the form of the artifact's cross section	Coded	<ul style="list-style-type: none"> <li>• 0 = N/A</li> <li>• 1 = flat</li> <li>• 2 = circular</li> <li>• 3 = triangular</li> <li>• 4 = oval</li> <li>• 5 = square</li> <li>• 6 = polygonal</li> </ul>	Manufacturing Stage/Process
Other Comments Section				
Weight (g)	Maximum weight of object	Numeral	Measured to nearest tenth of a gram	Weight

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Organic Residue	Whether any organic residue is present	Coded / Narrative	This cell will first give a coded letter describing whether organic residue is present: <ul style="list-style-type: none"> <li>• Y = Yes, there is organic residue present</li> <li>• M = Maybe there is organic residue present</li> <li>• N = There is no organic residue present</li> </ul> This letter will be followed by a narrative (if applicable) describing the location/nature of the organic residue.	Organic Residue
Photo #s	Numbers of digital photographs that were taken of the object	Narrative	The date that the image was taken will first be noted followed by a range of the numbers assigned to the digital images by the digital camera	Photo #s
Comments	Any information not covered in other cells or clarifications about coding	Narrative	Brief comments only including information not covered in other cells or clarifying code designation for an attribute.	Comments
Recorder	Initials of individual recording artifact data in Excel file	Narrative	JMP = Jacqueline Marie Pozza	Recorder
Date	Date of catalog entry	Numeral	Noted in the following format: month/date/year	Date
<b>Awls Only Section</b>				
Pointed	For needle-like ends or ends that were probably intended to be needle-like but show some wear	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Comments
Tapered	For ends that are narrowed but not exactly pointed or were probably intended to be tapered but show some wear	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Comments
Splayed	A flared out, mushroomed end that may have been from manufacture or is a result from use	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Comments
Broken	A term used to describe the fractured end of an awl	Coded	<ul style="list-style-type: none"> <li>• 0 = not present</li> <li>• 1 = present</li> </ul>	Comments
Length: Maximum (mm)	Maximum length of awl	Numeral	Measured to nearest hundredth of a millimeter	Length
Width: Center of Body (mm)	Widest measurement at approximate center of awl body	Numeral	Measured to nearest hundredth of a millimeter	Width

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Width: End 1 (mm)	Maximum width taken two millimeters from end tip in direction of center width measurement	Numeral	Measured to nearest hundredth of a millimeter	Width
Width: End 2 (mm)	Maximum width taken two millimeters from end tip in direction of center width measurement	Numeral	Measured to nearest hundredth of a millimeter	Width
Thickness: Center of Body (mm)	Maximum thickness taken 90 degrees from width measurement	Numeral	Measured to nearest hundredth of a millimeter	Thickness
Thickness: End 1 (mm)	Maximum thickness taken two millimeters from end tip in direction of center thickness measurement	Numeral	Measured to nearest hundredth of a millimeter	Thickness
Thickness: End 2 (mm)	Maximum thickness taken two millimeters from end tip in direction of center thickness measurement	Numeral	Measured to nearest hundredth of a millimeter	Thickness
Angle of Pointed Edge	Measurement taken two millimeters back from edge	Coded	<ul style="list-style-type: none"> <li>• 0 = N/A</li> <li>• 1 = 0-45 degrees</li> <li>• 2 = 46-75 degrees</li> <li>• 3 = greater than 75 degrees</li> </ul>	Comments
<b>Beads Only Section</b>				
Edges	The finish of the bead's edges, whether they were left irregular or were cleanly cut to create more even ends	Coded	<ul style="list-style-type: none"> <li>• 0 = irregularly cut</li> <li>• 1 = cleanly cut</li> </ul>	Comments
Shape of Rolled Over Seam Edge	Form of the rolled over side as it creates the outward seam edge	Coded	<ul style="list-style-type: none"> <li>• 0 = broken</li> <li>• 1 = squared</li> <li>• 2 = flared</li> <li>• 3 = tapered</li> <li>• 4 = irregular</li> </ul>	Comments

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Amount of Overlap of Seam Sides	How much of the two seam edges are overlapped to enclose the bead shape	Coded	<ul style="list-style-type: none"> <li>• 0 = seam sides not touching</li> <li>• 1 = 1-90 degrees</li> <li>• 2 = 91-180 degrees</li> <li>• 3 = 181-270 degrees</li> <li>• 4 = 271-260 degrees</li> <li>• 5 = 360+ degrees</li> </ul>	Comments
Rolled Under Seam Edge	A comment on the state of the rolled under seam edge, whether it was smoothed up against the outer edge, has a slight pinched section extending into the interior of the bead, or if this edge cannot be observed due to the current state of the bead	Coded	<ul style="list-style-type: none"> <li>• 0 = indeterminate</li> <li>• 1 = smoothed</li> <li>• 2 = pinched</li> </ul>	Comments
Special Shape	Any shape that does not fit the predominant cylindrical bead form that is roughly three times as long as its width	Coded	<ul style="list-style-type: none"> <li>• 0 = no special shape</li> <li>• 1 = globular</li> <li>• 2 = tubular</li> <li>• 3 = other               <ul style="list-style-type: none"> <li>○ If 3 is used, then a description of the object will be included in the comment section of the entry</li> </ul> </li> </ul>	Comments
Seam Alignment	Alignment of the rolled under and over side edges to create the seam	Coded	<ul style="list-style-type: none"> <li>• 0 = flush</li> <li>• 1 = askew</li> </ul>	Comments
Length: Full (mm)	Maximum length of bead	Numeral	Measured to nearest hundredth of a millimeter	Length
Length: Seam (mm)	Maximum length of seam side	Numeral	Measured to nearest hundredth of a millimeter	Length
Length: Side Opposite Seam (mm)	Maximum length of side opposite of seam	Numeral	Measured to nearest hundredth of a millimeter	Length
Width: Maximum (mm)	Maximum width of bead with seam facing upward	Numeral	Measured to nearest hundredth of a millimeter	Width
Width: Top Orifice (mm)	Maximum width of top orifice (formed by upper bead edge) measured two millimeters from bead edge	Numeral	Measured to nearest hundredth of a millimeter	Width

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Width: Bottom Orifice (mm)	Maximum width of bottom orifice (formed by lower bead edge) measured two millimeters from bead edge	Numeral	Measured to nearest hundredth of a millimeter	Width
Thickness: Rolled Over Side (mm)	Maximum thickness two millimeters from bead edge of rolled over side	Numeral	Measured to nearest hundredth of a millimeter	Thickness
Thickness: Side Opposite Seam (mm)	Maximum thickness two millimeters from bead edge of side opposite seam	Numeral	Measured to nearest hundredth of a millimeter	Thickness
<b>Tinkler Cones Only Section</b>				
Edges	The finish of the cone's edges, whether they were left irregular or were cleanly cut to create more even ends	Coded	<ul style="list-style-type: none"> <li>• 0 = irregularly cut</li> <li>• 1 = cleanly cut</li> </ul>	Comments
Shape of Rolled Over Seam Edge	Form of the rolled over side as it creates the outward seam edge	Coded	<ul style="list-style-type: none"> <li>• 0 = broken</li> <li>• 1 = squared</li> <li>• 2 = flared</li> <li>• 3 = tapered</li> <li>• 4 = irregular</li> </ul>	Comments
Amount of Overlap of Seam Sides	How much of the two seam edges are overlapped to enclose the cone shape	Coded	<ul style="list-style-type: none"> <li>• 0 = seam sides not touching</li> <li>• 1 = 1-90 degrees</li> <li>• 2 = 91-180 degrees</li> <li>• 3 = 181-270 degrees</li> <li>• 4 = 271-260 degrees</li> <li>• 5 = 360+ degrees</li> </ul>	Comments
Rolled Under Seam Edge	A comment on the state of the rolled under seam edge, whether it was smoothed up against the outer edge, has a slight pinched section extending into the interior of the cone, or if this edge cannot be observed due to the current state of the cone	Coded	<ul style="list-style-type: none"> <li>• 0 = indeterminate</li> <li>• 1 = smoothed</li> <li>• 2 = punched</li> </ul>	Comments
Seam Alignment	Alignment of the rolled under and over side edges to create the seam	Coded	<ul style="list-style-type: none"> <li>• 0 = flush</li> <li>• 1 = askew</li> </ul>	Comments

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Length: Full (mm)	Maximum length of cone	Numeral	Measured to nearest hundredth of a millimeter	Length
Length: Seam (mm)	Maximum length of seam side	Numeral	Measured to nearest hundredth of a millimeter	Length
Length: Side Opposite Seam (mm)	Maximum length of side opposite of seam	Numeral	Measured to nearest hundredth of a millimeter	Length
Width: Top (mm)	Maximum width of the top of the cone with seam facing upward	Numeral	Measured to nearest hundredth of a millimeter	Width
Width: Base (mm)	Maximum width of base of the cone with seam facing upward	Numeral	Measured to nearest hundredth of a millimeter	Width
Width: Top Orifice (mm)	Maximum width of top orifice measured two millimeters from bead edge	Numeral	Measured to nearest hundredth of a millimeter	Width
Width: Base Orifice (mm)	Maximum width of base orifice measured two millimeters from bead edge	Numeral	Measured to nearest hundredth of a millimeter	Width
Thickness: Rolled Over Side (mm)	Maximum thickness two millimeters from base edge of rolled over side	Numeral	Measured to nearest hundredth of a millimeter	Thickness
Thickness: Side Opposite Seam (mm)	Maximum thickness two millimeters from base edge of side opposite seam	Numeral	Measured to nearest hundredth of a millimeter	Thickness
<b>Pendants Only Section</b>				
Attachment Type	Description of feature used to attach the pendant to another object, such as a rope or piece of leather	Coded	<ul style="list-style-type: none"> <li>• 0 = attachment not present or indistinguishable</li> <li>• 1 = rolled over</li> <li>• 2 = punched               <ul style="list-style-type: none"> <li>○ If 2 is used, the amount of punches will be noted in the comments of the entry</li> </ul> </li> <li>• 3 = other               <ul style="list-style-type: none"> <li>○ If 3 is used, a description of the object will be included in the comments of the entry</li> </ul> </li> </ul>	Comments

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Pendant Shape	Overall shape of the pendant	Coded	<ul style="list-style-type: none"> <li>• 0 = indeterminate shape</li> <li>• 1 = serpentine</li> <li>• 2 = circular</li> <li>• 3 = mace-shaped</li> <li>• 4 = talon-shaped</li> <li>• 5 = shield-shaped</li> <li>• 6 = teardrop-shaped</li> <li>• 7 = trapezoidal</li> <li>• 8 = triangular</li> <li>• 9 = other</li> </ul>	Comments
End Shape	Description of the shape of the pendant's end, which is opposite the head	Coded	<ul style="list-style-type: none"> <li>• 0 = broken</li> <li>• 1 = pointed</li> <li>• 2 = tapered</li> <li>• 3 = squared/flat</li> <li>• 4 = polygonal</li> <li>• 5 = rounded</li> <li>• 6 = other</li> </ul>	Comments
Length: Full (mm)	Maximum length of entire object	Numeral	Measured to nearest hundredth of a millimeter	Length
Length: Head (mm)	Maximum length of head	Numeral	Measured to nearest hundredth of a millimeter	Length
Length: Body (mm)	Maximum length of body	Numeral	Measured to nearest hundredth of a millimeter	Length
Width: Full (mm)	Maximum width of entire object	Numeral	Measured to nearest hundredth of a millimeter	Width
Width: Head (mm)	Maximum head width	Numeral	Measured to nearest hundredth of a millimeter	Width
Width: Body (mm)	Maximum body width	Numeral	Measured to nearest hundredth of a millimeter	Width
Thickness: Head (mm)	Center of rolled over side or punctured head	Numeral	Measured to nearest hundredth of a millimeter	Thickness
Thickness: Body (mm)	Maximum body thickness	Numeral	Measured to nearest hundredth of a millimeter	Thickness

Cell	Information Recorded by Cell	Type of Entry	Description of Code or Narrative	Location of Cell Data on Artifact Form
Fragments Only Section				
General Shape	Descriptive code for the general shape of the fragment.	Coded	<ul style="list-style-type: none"> <li>• 0 = irregular</li> <li>• 1 = round</li> <li>• 2 = triangular</li> <li>• 3 = oval</li> <li>• 4 = square</li> <li>• 5 = polygonal</li> </ul>	Comments
Possible Intended Form	Assumption of intended form based on observations.	Coded	<ul style="list-style-type: none"> <li>• 0 = indeterminate</li> <li>• 1 = awl</li> <li>• 2 = bead</li> <li>• 3 = pendant</li> <li>• 4 = tinkler cone</li> <li>• 5 = other               <ul style="list-style-type: none"> <li>○ If 5 is used, a description of the object will be included in the comments of the entry</li> </ul> </li> </ul>	Comments
Length (mm)	Maximum length (using flat edge to orient object if present)	Numeral	Measured to nearest hundredth of a millimeter	Length
Width (mm)	Maximum width, 90 degrees from length	Numeral	Measured to nearest hundredth of a millimeter	Width
Thickness (mm)	Maximum thickness	Numeral	Measured to nearest hundredth of a millimeter	Thickness

**APPENDIX C:**  
**AWLS OF THE CRABAPPLE POINT, CRESCENT BAY HUNT CLUB, SCHMELING,**  
**AND KOSHKONONG CREEK VILLAGE SITES**

# Artifact: BW-1

Recorder: JMP Date: 4/27/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Awl

## Length:

Maximum: 25.33mm

## Width:

Center of body: 3.52mm

End 1: 0.78mm

End 2: 1.98mm

## Thickness:

Center of body: 3.09mm

End 1: 0.78mm

End 2: 1.98mm

Weight: 0.9g

## Patina:

**Type A:** Present on 1-25% of object

**Type B:** Not present

**Type C:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type C throughout with areas of Type A and accretions. Type D along recesses.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 1-25% of object

**Pitting:** Present on 1-25% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Present

**Incisions:** Not present

### Description of Use-Wear

**Amount/Location:** Pointed tip slightly bent. Cracks/striations throughout body that appear to be from fold over hammered manufacturing. Tapered end may have an area missing or the recess could be from manufacture. Possibly resharpened? Possible nick near pointed end? Has channeling from center to tapered end on one side.

### Smoothing:

**Pre-Use:** Present

**Use:** Not present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Not present

### Retooling:

**Reharpended:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** N

## Comments:

### Edges:

**Pointed:** Present

**Tapered:** Present

**Flattened:** Not present

**Splayed:** Not present

**Broken:** Not present

**Angle of Pointed Edge:** 0-45 degrees

**General Comments:**

## Artifact: BW-2

Recorder: JMP Date: 4/27/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Awl

### Length:

Maximum: 77.12mm

### Width:

Center of body: 5.24mm

End 1: 2.56mm

End 2: 2.96mm

### Thickness:

Center of body: 4.84mm

End 1: 2.56mm

End 2: 2.96mm

Weight: 9.2g

### Patina:

**Type A:** Present on 26-50% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 51-75% of object

**Type D:** Present on 26-50% of object

**Location of Patina/Corrosion:** Type C throughout with areas of Type A and accretions. Type D along recesses and Type E near cracked portions.

**Type E:** Present on 1-25% of object

**Accretions:** Present on 26-50% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Present

**Incisions:** Not present

**Smoothing:**

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

**Loss:**

**Description of Use-Wear Amount/Location:** Ends are worn, possibly from use with the slimmer end having a slight bend. Areas around center of body are cracked and slightly separated from body (a signature of fold over hammered manufacturing). Some light striations running parallel to awl's body. Slight worn line across body closer to slimmer end, possibly from hafting? Has channeling in center - from center to one tapered end away from bend (some on bent side) on one side, square to circular cross-section.

**Broken Piece:** Not present

**Nicks:** Not present

**Retooling:**

**Reharpended:** Not present

**Repaired:** Not present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

### Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Square

Organic Residue Present? (Y= Yes; M = Maybe; N = No): N

### Comments:

**Edges:**

**Pointed:** Not present

**Tapered:** Present

**Flattened:** Not present

**General Comments:** Slimmer end = End 1.

**Splayed:** Not present

**Broken:** Not present

**Angle of Pointed Edge:**

N/A

# Artifact: BW-3

Recorder: JMP Date: 4/27/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Awl

## Length:

Maximum: 25.02mm

## Width:

Center of body: 3.82mm

End 1: 1.8mm

End 2: 0.6mm

## Thickness:

Center of body: 3.1mm

End 1: 1.8mm

End 2: 0.6mm

Weight: 1g

## Patina:

**Type A:** Present on 1-25% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type C throughout with areas of Type A and accretions. Type D along recesses.

**Type D:** Present on 1-25% of object

**Type E:** Not present

Description of Use-Wear Amount/Location: Possible break from center running longitudinally to broken edge. Could also have been from impurity in copper during manufacture since sides of "broken" area is slightly smoothed over. Or perhaps repaired or resharpened. Cracks and separated layers on tapered edge. Has channeling in center - that break on one end, on one side may just be an impurity though why would they leave it like that.

Description of Use-Wear Amount/Location: Finely made. One end is pointed and one end is precisely flattened and rounded. Small nick taken out of pointed end. Thinned and rounded edge has polish from wear with what looks like a small chip taken out of one side. Flattened rounded edge has a flatter side and a more humped side. Two opposite sides of portion of awl with flattened rounded edge is pinched or worn slightly. Striations run transversely throughout awl body and mostly near portion closest to the pointed end. Darker accretions near center of awl. Square cross-section shape is rounded toward pointed end of awl.

**Description of Use-Wear Amount/Location:** One end has large crack and possible portion missing. Two halves made from this crack are splayed apart from one another. Significant dent on one side in the center of the awl's body where crack ends. Lines of polish near center of awl's body near this dent. One of these areas of polish, running transversely across body of awl, has significant incision. Perhaps this wear at center of awl is from edge of hafting element or perhaps was curated on a three-pointed mount previously by Mr. Bussey? Some slight dents and transverse striations along tapered edge. Tip of tapered edge is smooth. Channeling on both sides.

### Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Square

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** Y - between crack's sides at one end

**Cracking:** Not present

**Bending:** Present

**Striations:** Present

**Incisions:** Not present

**Smoothing:**

**Description of Use-Wear Amount/Location:** Cross-section is square at center and ends were rounded. Slight bend near pointed end. Polish around body near tapered end where cross-section becomes rounder. Tapered edge is rounded and appears to have wear on the tip with one side splayed a bit down toward the body of the awl but was flattened against it. One corner of square cross-section on half of awl near tapered edge was scraped to flatten. Half with tapered edge is also slightly bent.

**Description of Use-Wear Amount/Location:** Awl has significant bend near center of body. At this bend, there is a significant crack that runs across the awl transversely and a layer has slightly splayed from the body of this awl at this crack. Crack near tapered edge that also runs transversely and has a layer that is slightly splayed. Striations/incisions running transversely across awl's body at center of awl where cross-section is square. One edge is flattened/thinned and rounded with one adjacent side more humped and the other side flatter. Polish along humped edge and along one edge of square cross-section. Edge of this flattened end also has small worn nicks in it, especially in one corner where the edge meets the thinner adjacent side. Used to scrape a material?

## Manufacturing Stage/Processes:

**Description of Use-Wear Amount/Location:** Thinned/flattened end is rounded and has small chip out of its center. Striations/incisions stemming from this edge run perpendicular to edge. Some possible polish along the widest sides adjacent to this edge. Pointed end may have small nick at end and is slightly bent. Two worn areas running transverse to awl's body near flattened edge that runs across the widest side and following to one of the adjacent thinner sides. Appears that cross-section started as square and then pointed end was rounded and flatter end was rounded and flattened.

**Description of Use-Wear Amount/Location:** Broken end? Could also be irregular end left during manufacture. Near this end is a large crack that runs longitudinally down body of awl. Layer separated by this crack is slightly splayed from rest of body. Striations running transversely across body of wider sides. Slight bend near tapered edge. Both tips are rounded, possibly from wear. Some polish running transversely cross center of awl. Slight cracks/striations running longitudinally along awl body possibly from fold over hammered manufacturing. Has channeling at center of one side.

## Manufacturing Stage/Processes:

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Shape indicates that cross-section started as a square and was rounded, especially on one half with pointed end that has larger angle. Cracks running longitudinally along body from sharper pointed end and recess near this tip are probably from fold over hammered manufacturing. Possible nicks on the tip of this sharper end. Polish on end with less sharp point, which also has cracks and either a nick or an impurity from manufacture. Sharper point could have been resharpened. Has channeling from enter to pointed end on both sides.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Square

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** N

**Description of Use-Wear Amount/Location:** Bend at center of awl and one near pointed end. Crack starting at tip of pointed end and running longitudinally down body of awl, possibly from use or manufacture. Deep incision perpendicular to awl body near pointed tip. Cross-section is square with both ends having more of a circular cross-section. Polish on areas of awl from pointed tip to bend at center of body. Tapered edge is rounded and may have polish, though accretions are thick on this half of awl. Channeling from center toward tapered end on both sides.

## Manufacturing Stage/Processes:

**Cracking:** Present

**Bending:** Not present

**Striations:** Present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Possibly an object that split in half longitudinally? Could have been a projectile point or rolled awl. Flattened edge is very thin and appears to have some slight nicks along its edge. Cracks and striations stem down the awl from pointed end to flattened end, but appear to be more from manufacture. Accretions, form, and pitting make other use-wear difficult to observe. \*deep channeling through 2/3 of one side from lower center to flat end

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:**

Nick/ridge/step in side of tapered edge as if worn by boring holes. Tapered edge is slightly splayed. Opposite end is very splayed and may be a broken end. One half of this side may have been pressed into a mold. Sides of object have many dents, probably from fold over hammered manufacturing.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Roughly manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Square

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** Y

- in broken end

**Comments:**

**Edges:**

**Pointed:** Not present

**Tapered:** Present

**Flattened:** Not present

**Splayed:** Present

**Broken:** Not present

**Angle of Pointed Edge:**

N/A

**General Comments:** Object closest resembles an awl, so it was documented in the awl section that follows. This object is very hefty and may have had other functions.

# Artifact: S-10

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Pointed tip is slightly splayed with small nick in tip. Quarter section of body closest to pointed tip is slightly bent following direction of tip splaying. Both could possibly be a result from stress of use. Indentations along center of body. Section of body has slightly pulled away from rest of body, though this looks to be a layer from manufacture that was not fully worked into the rest of the body. Cracks running along body probably from layers of manufacture. Slight recess in blunt edge that appears to be left over from imperfect manufacturing. Blunt end slightly smoothed, probably from use by holding in hand or by being hafted onto a handle?

## Manufacturing Stage/Processes:

**Level of Manufacture:** Roughly manufactured object

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Square

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** M - in recess of thicker edge? In pockets of roughed up point?

## Thickness:

Rolled Over Side: 0.72mm  
Side Opposite Seam: 0.49mm

Weight: 0.5g

## Patina:

**Type A:** Present on 51-75% of object

**Type B:** Present on 1-25% of object

**Type C:** Not present

**Type D:** Not present

**Location of Patina/Corrosion:** Accretions, pitting, and Type A throughout. Type B in specks on side opposite seam.

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 51-75% of object

## Total Surface Area with

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

### Smoothing:

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Rounding on bead's edges. Seems to be some polish on rolled under side that extends to half of side opposite of seam; since this polish is on areas of heavy Type A patina, it may have occurred after deposition. Seam of rolled over edge smoothed against rest of bead body with some possible material placed between this edge and the rolled under side in order to disguise the seam.

## Manufacturing Stage/Processes:

### Level of Manufacture:

Moderately refined  
manufactured artifact

### Possible Manufacturing Method:

Folded over and cold hammered

### Possible Shaping Method:

Cut from blank and rolled, boxy

### Decorations Present:

Not present

### Decoration Description (if present):

### Cross-Section Shape:

Circular

## Organic Residue Present? (Y =

Yes; M = Maybe; N = No): M -

some accretions on interior

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:**

Flared

**Amount of Overlap of Seam**

**Sides:** 181-270 degrees

**Rolled Under Seam Edge:** Pinched

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

# Artifact: B72-9

Recorder: JMP

Date: 7/3/2015

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 12.1mm  
Seam: 8.5mm  
Side Opposite Seam:  
8.69mm

**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type A and accretions throughout with some pitting. Type B on side opposite seam.

**Manufacturing Marks and/or Use-Wear:**

**Stress Damage:**

**Mushrooming/Splaying:** Not present  
**Cracking:** Present  
**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Crack roughly 2mm in size starting on lower edge of bead near seam and extending upward and to the right. Significant bend inward along lower edge of bead on left side. Shallow striations throughout bead with some deeper striations making a cross on the side opposite the seam. It appears that many of these striations are through the bead's surface deterioration, so these marks may be from recent curation.

**Smoothing:**

**Pre-Use:** Not present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Crack on upper half of rolled under side lead to this area being bent inward. Left side also had two cracks in upper bead edge with area between these cracks folded outward and against the bead body. Side opposite seam is rather polished. Seems that bead may have been polished prior to use, because of use, and/or after deposition. Deep incisions on top of rolled under and rolled over sides as well as on lower bead edge of side opposite seam could be from wear or are decorated. Seam of rolled over edge smoothed against rest of bead body.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Present

**Decoration Description (if present):** Incisions on top half of top portion of rolled under and rolled under sides and on lower

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

**Comments:**

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam**

**Sides:** 1-90 degrees

**Rolled Under Seam Edge:**

Pinched

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

bead edge of side opposite seam - Decorative?

**Cross-Section Shape:** Oval

# Artifact: B72-29

Recorder: JMP

Date: 1/9/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 11.91mm  
Seam: 9.33mm  
Side Opposite Seam:  
11.11mm

## Width:

Maximum: 6.89mm  
Top Orifice: 3.57mm  
Bottom Orifice: 4.4mm

## Thickness:

Rolled Over Side: 1.31mm  
Side Opposite Seam: 0.64mm

Weight: 1g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 1-25% of object

**Location of Patina/Corrosion:** Mostly covered in Type A patina. Accretions mostly on side opposite seam.

**Type D:** Not present

**Type E:** Not present

**Accretions:** Present on 26-50% of object

**Pitting:** Present on 1-25% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Not present

**Incisions:** Present

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Two incisions on left side and one on right near longitudinal center running parallel to bead's edge, since these are on bends of the bead they probably are scratches from use. Smoothed bead's edges. Sizeable bend on lower edge of rolled under side. Two nicks on upper bead edge (one on rolled under side, one on side opposite seam) and one on lower bead edge on side opposite seam that are probably from extensive use. Upper half of seam of rolled over edge smoothed against rest of bead body.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** M - on interior?

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Tapered

**Amount of Overlap of Seam Sides:** 91-180 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:** From top edge, looks boxily rolled; from bottom edge, looks folded.

# Artifact: B72-30

Recorder: JMP

Date: 1/9/2016

**Reported Provenience:** Crabapple Point, Bussey Collection

**Morphofunctional Designation:** Bead

**Length:**

Full: 11.19mm  
Seam: 9.61mm  
Side Opposite Seam:  
8.94mm

**Width:**

Top Orifice: 2.26mm  
Bottom Orifice: 3.22mm

**Thickness:**

Rolled Over Side: 0.87mm  
Side Opposite Seam: 0.76mm

**Weight:** 0.5g

**Patina:**

**Type A:** Present on 76-100% of object

**Type B:** Not present

**Type C:** Present on 1-25% of object

**Location of Patina/Corrosion:** Body of bead mostly covered with Type A and accretions. Bead's edges are mostly covered in Type C.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 51-75% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

**Manufacturing Marks and/or Use-Wear:**

**Stress Damage:**

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Not present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Bead surface smoothed probably during manufacture. Bead edges worn from use with worn-down nicks on center of top edge on side opposite seam and on bottom edge center of rolled under side and on center of side opposite of seam. Seam of rolled over edge smoothed against rest of bead body.

**Smoothing:**

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

**Loss:**

**Broken Piece:** Not present

**Nicks:** Present

**Retooling:**

**Resharpener:** Not present

**Nicks:** Not present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Striations running transversely on bead's body, especially on rolled over side. Some striations/incisions running relatively perpendicular to seam edge on rolled under side. These striations and striations/incisions appear to be manufacturing marks that were efforts to smooth out the bead to create a uniform surface. Seam of rolled over edge smoothed against rest of bead body with some possible green/dark brown/reddish brown material placed between this edge and the rolled under side in order to disguise the seam.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, smooth

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:**

Squared

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:**

**Location of Patina/Corrosion:** Accretions cover majority of bead surface. Type A along bead's edges.

**Type E:** Not present  
**Accretions:** Present on 76-100% of object  
**Pitting:** Not present

**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present  
**Cracking:** Not present  
**Bending:** Not present  
**Striations:** Not present  
**Incisions:** Not present

### Smoothing:

**Pre-Use:** Not present  
**Use:** Present  
**Incidental:** Not present

### Retooling:

**Resharpener:** Not present  
**Repaired:** Not present

### Recent:

**Cleaned:** Not present  
**Reuse:** Not present  
**Curation:** Not present

**Description of Use-Wear Amount/Location:** Use-wear hard to decipher because of accretions on surface. Rounding on bead's edges. Seam of rolled over edge smoothed against rest of bead body.

## Manufacturing

### Stage/Processes:

**Level of Manufacture:**  
Moderately refined  
manufactured artifact  
**Possible Manufacturing Method:**  
Folded over and cold  
hammered  
**Possible Shaping Method:**  
Folded  
**Decorations Present:** Not  
present  
**Decoration Description (if  
present):**  
**Cross-Section Shape:** Triangular

**Organic Residue Present? (Y =  
Yes; M = Maybe; N = No):** N

### Comments:

**Bead Edges:** Cleanly cut  
**Shape of Rolled Over Seam Edge:**  
Tapered  
**Amount of Overlap of Seam**  
**Sides:** 91-180 degrees  
**Rolled Under Seam Edge:**  
Smoothed  
**Special Shape:** No special shape  
**Seam Alignment:** Flush  
**General Comments:**

# Artifact: B72-40

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Nick on upper bead edge on side opposite of seam. A couple of deep striations and incisions on bead's body - one on each side of the seam running parallel to seam and a very deep incision on side opposite of seam running transversely along center on this side. Bead's edges are slightly worn from use.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Present

**Decoration Description (if present):**

Deep incisions are decorations? The incision on the side opposite the seam definitely looks to be intentional.

**Cross-Section Shape:** Square

**Organic Residue Present? (Y = Yes;**

**M = Maybe; N = No):** M - on interior?

**Comments:**

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 181-270 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:** Also has more vibrant red patina, 10R 4/12.

**Recent:**  
**Cleaned:** Not present  
**Reuse:** Not present  
**Curation:** Not present

**Description of Use-Wear Amount/Location:** Crack along the full transverse length of the bead on the side opposite the seam. A nick on the top edge of the rolled under side and one on the bottom edge of the side opposite the seam. Slight bend inward on the top edge of the rolled over side.

## Manufacturing Stage/Processes:

### Level of Manufacture:

Moderately refined manufactured artifact

### Possible Manufacturing Method:

Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Flared

**Amount of Overlap of Seam Sides:** 271-260 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

# Artifact: B72-50

Recorder: JMP

Date: 1/11/2016

**Reported Provenience:** Crabapple Point, Bussey Collection

**Morphofunctional Designation:** Bead

## Length:

Full: 15.54mm  
Seam: 12.89mm  
Side Opposite Seam:  
12.73mm

## Width:

Maximum: 6.52mm  
Top Orifice: 2.46mm  
Bottom Orifice: 5.85mm

## Thickness:

Rolled Over Side: 0.43mm  
Side Opposite Seam: 0.35mm

**Weight:** 0.7g

## Patina:

**Type A:** Present on 26-50% of object

**Type B:** Present on 26-50% of object

**Type C:** Not present

**Type D:** Not present

**Location of Patina/Corrosion:** Type A and B throughout with some thicker polish.

**Type E:** Not present

**Accretions:** Present on 1-25% of object

**Pitting:** Not present

## Total Surface Area with

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Present

**Incisions:** Present

### Smoothing:

**Pre-Use:** Not present

**Use:** Not present

**Incidental:** Present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Present

**Description of Use-Wear Amount/Location:** Bead bent inward at various spots along body and on upper bead edge of the rolled over side and the lower half of the side opposite of seam. An incision runs from the upper seam edge of the rolled over side down to the lower portion of the right side, continues across a bent break to extend across the side opposite the seam, and extends to the lower seam edge of the rolled under side; decorative? Polish on the higher areas of the bead's crushed surface. Crack running transversely on side opposite of seam. Rope that Bussey used to string together beads was stuck inside of this one and needed some force to remove. Could have caused wear on interior.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Present

**Decoration Description (if present):** Incision running throughout bead is decorative?

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** M - in interior?

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:**

Irregular

**Amount of Overlap of Seam Sides:** 91-180 degrees

**Rolled Under Seam Edge:**

Indeterminate

**Special**

**Shape:**

Other

**Seam**

**Alignment:**

Askew

**General Comments:** This bead almost looks like it was made of two pieces. It is so deformed that it is difficult to decipher how it was manufactured. May possibly not even be a bead, but a highly damaged object. Shape could be a Z or W shape where inside is in between to pinched rolled sides?

**Cross-Section Shape:** Polygonal

# Artifact: B72-51

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Indeterminate

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

# Artifact: B72-60

Recorder: JMP

Date: 1/11/2016

**Reported Provenience:** Crabapple Point, Bussey Collection

**Morphofunctional Designation:** Bead

**Length:**

Full: 16.3mm  
Seam: 14.32mm  
Side Opposite Seam:  
15.98mm

**Width:**

Maximum: 7.47mm  
Top Orifice: 5.55mm  
Bottom Orifice: 6.62mm

**Thickness:**

Rolled Over Side: 0.52mm  
Side Opposite Seam: 0.4mm

**Weight:** 0.8g

**Patina:**

**Type A:** Present on 26-50% of object  
**Type B:** Not present  
**Type C:** Present on 1-25% of object  
**Type D:** Present on 1-25% of object

**Type E:** Not present  
**Accretions:** Present on 51-75% of object  
**Pitting:** Not present

**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type A mostly on rolled over side and along edges and bends. Accretions throughout, especially on side opposite of seam. Some Type C mixed with the Type A on rolled over side.

**Manufacturing Marks and/or Use-Wear:**

**Stress Damage:**

**Mushrooming/Splaying:** Present  
**Cracking:** Not present  
**Bending:** Present  
**Striations:** Present  
**Incisions:** Present

**Pre-Use:** Present

**Use:** Present  
**Incidental:** Not present

**Resharpener:** Not present

**Repaired:** Not present

**Recent:**

**Cleaned:** Not present  
**Reuse:** Not present  
**Curation:** Not present

**Loss:**

**Broken Piece:** Not present  
**Nicks:** Present

**Smoothing:**

**Retooling:**

**Description of Use-Wear Amount/Location:** Bead is deformed, possibly from use or is post deposition damage. Possible decorative etchings on side opposite of seam. Some striations throughout, especially on lower portion of rolled over side seam, which look like possible manufacturing marks from bending the blank or smoothing out the seam. Bead's edges are smoothed from use and two nicks are worn into lower bead edge of rolled over side.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact  
**Possible Manufacturing Method:** Possibly cut from copper or brass kettle  
**Possible Shaping Method:** Folded

**Decorations Present:** Present

**Decoration Description (if present):** Striations on side opposite of seam possibly decoration?

**Cross-Section Shape:** Triangular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

**Comments:**

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Tapered

**Amount of Overlap of Seam Sides:** 181-270 degrees

**Rolled Under Seam Edge:** Pinched

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:** Maybe brass? Etchings on side opposite seam? More cross-hatches?

### Smoothing:

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Not present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** A couple of possible incisions stemming from edge on bottom half of rolled under side. Smoothed bead edges from use. Seam of rolled over edge smoothed against rest of bead body with some possible black material placed between this edge and the rolled under side in order to disguise the seam.

## Manufacturing Stage/Processes:

### Level of Manufacture:

Moderately refined manufactured artifact

### Possible Manufacturing Method:

Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, smooth

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** M - in interior?

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Tapered

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:**

# Artifact: B72-71

Recorder: JMP

Date: 1/11/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 5.95mm  
Seam: 5.21mm  
Side Opposite Seam:  
5.78mm

## Width:

Maximum: 5.07mm  
Top Orifice: 2.56mm  
Bottom Orifice: 3.09mm

**Description of Use-Wear Amount/Location:** Seam is very smoothed over, probably done during manufacture. Bead edges are rounded from use and have some areas where the smoothing is so significant that there are nicks to the edge (top and bottom edges of the rolled under side and top edge of side opposite seam). Seam of rolled over edge smoothed against rest of bead body with some possible dark brown material placed between this edge and the rolled under side in order to disguise the seam.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Finely manufactured artifact  
**Possible Manufacturing Method:** Folded over and cold hammered

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Striations/incisions sprouting from seam on rolled over side and running transversely across bead throughout. Possible incisions/striations running longitudinally along bead in center. Seam is smoothed over and has some incisions/striations along edges, probably done during manufacture. Bead edges are rounded from use and have all of upper bead edge except for left side has smoothing that is so significant that there are worn nicks. Top portion of rolled under side is slightly bent inward. Seam of rolled over edge smoothed against rest of bead body with some possible brown and teal material placed between this edge and the rolled under side in order to disguise the seam.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, smooth

**Decorations Present:** Present

**Decoration Description (if present):**  
Striations/incisions decorative?

**Organic Residue Present? (Y = Yes; M =**

**Maybe; N = No):** M - between rolled edges?

**Comments:**

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:**  
Tapered

**Amount of Overlap of Seam Sides:** 91-180 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:**

**Cross-Section Shape:** Circular

**Patina/Corrosion:** Present on 76-100% of object

**Manufacturing Marks and/or Use-Wear:**

**Stress Damage:**

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Not present

**Incisions:** Present

**Description of Use-Wear Amount/Location:** Two incisions running longitudinally across bead on side opposite of seam. Bead edges are smoothed from use.

**Smoothing:**

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

**Loss:**

**Broken Piece:** Not present

**Nicks:** Not present

**Retooling:**

**Resharpener:** Not present

**Repaired:** Not present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, smooth

**Decorations Present:** Present

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** M - in interior?

**Comments:**

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Squared

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:** Thick accretions on interior of bead - perhaps some organic material was preserved? Thickness is probably closer to 0.8, but was difficult to measure due to amount of interior accretions.

**Decoration Description (if present):** Incisions on side opposite of seam?

**Cross-Section Shape:** Circular

# Artifact: B72-92

Recorder: JMP

**Reuse:** Not present  
**Curation:** Not present

**Description of Use-Wear Amount/Location:** Smoothed bead edges from use. Some loss on upper edge of rolled under side. Light striations running transversely on bead, especially on rolled under side. Marks along rolled over side's seam edge appear to be manufacturing marks to smooth seam. Possible slight cracks on upper half of rolled under side, but accretions make the surface difficult to examine. Seam of rolled over edge smoothed against rest of bead body.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Present

**Organic Residue Present?**

(Y = Yes; M = Maybe; N = No): M - in between rolled over and under sides?

**Comments:**

**Bead Edges:** Cleanly cut  
**Shape of Rolled Over Seam Edge:** Flared  
**Amount of Overlap of Seam Sides:** 181-270 degrees  
**Rolled Under Seam Edge:** Smoothed  
**Special Shape:** No special shape  
**Seam Alignment:** Flush  
**General Comments:** Possible decoration?

**Decoration Description (if present):** Striations running longitudinally throughout

**Cross-Section Shape:** Triangular

# Artifact: B72-102

Recorder: JMP

Date: 4/25/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 12.17mm  
Seam: 10.05mm  
Side Opposite Seam:  
10.2mm

## Width:

Maximum: 6.33mm  
Top Orifice: 4.05mm  
Bottom Orifice: 4.45mm

## Thickness:

Rolled Over Side: 0.94mm  
Side Opposite Seam: 0.52mm

Weight: 0.8g

## Patina:

**Type A:** Present on 1-25% of object  
**Type B:** Present on 1-25% of object  
**Type C:** Present on 76-100% of object

**Type D:** Present on 1-25% of object  
**Type E:** Not present  
**Accretions:** Present on 1-25% of object

**Pitting:** Present on 26-50% of object  
**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type C throughout with areas of Type A. Type D follows recesses.

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present  
**Cracking:** Not present  
**Bending:** Not present  
**Striations:** Present  
**Incisions:** Not present

### Smoothing:

**Pre-Use:** Not present  
**Use:** Present  
**Incidental:** Not present

### Retooling:

**Resharpener:** Not present  
**Repaired:** Not present  
**Recent:**  
**Cleaned:** Not present  
**Reuse:** Not present  
**Curation:** Not present

### Loss:

**Broken Piece:** Not present  
**Nicks:** Present

**Description of Use-Wear Amount/Location:** Smoothed bead edges with areas of loss on upper edge of left side and lower edge of right side. Light striations on rolled over side, especially on seam edge. Seam of rolled over edge smoothed against rest of bead body with some possible black material placed between this edge and the rolled under side in order to disguise the seam.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Roughly manufactured artifact  
**Possible Manufacturing Method:** Folded over and cold hammered  
**Possible Shaping Method:** Cut from blank and rolled, boxy  
**Decorations Present:** Present  
**Decoration Description (if present):** Striations on rolled over side  
**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Irregularly cut  
**Shape of Rolled Over Seam Edge:** Irregular  
**Amount of Overlap of Seam Sides:** 181-270 degrees  
**Rolled Under Seam Edge:** Smoothed  
**Special Shape:** No special shape  
**Seam Alignment:** Askew  
**General Comments:** Possible decoration?

**Description of Use-Wear Amount/Location:** Cracks and losses along bead's edges, especially on right and left side of top edge. Right side of lower edge is bent inward slightly. Striations/incisions running perpendicularly from rolled over side's seam edge and two stemming perpendicularly from top edge of rolled over side. Striations running transversely throughout. Decorations or manufacturing marks? A portion of the top edge of the right side was cracked and bent toward the front of the bead leaving a pinched tab. Seam of rolled over edge smoothed against rest of bead body with some possible black material placed between this edge and the rolled under side in order to disguise the seam.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Present

# Artifact: B72-112

Recorder: JMP

Date: 4/25/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 8.89mm  
Seam: 7.24mm  
Side Opposite Seam:  
8.62mm

## Width:

Maximum: 3.28mm  
Top Orifice: 1.83mm  
Bottom Orifice: 1.91mm

## Thickness:

Rolled Over Side: 0.65mm  
Side Opposite Seam: 0.34mm

Weight: 0.2g

## Patina:

**Type A:** Present on 51-75% of object  
**Type B:** Not present  
**Type C:** Present on 1-25% of object  
**Type D:** Not present

**Type E:** Not present  
**Accretions:** Present on 76-100% of object  
**Pitting:** Present on 26-50% of object

**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Accretions and Type A throughout, especially on right side. Some Type C on rolled over side.

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present  
**Cracking:** Not present  
**Bending:** Present

**Striations:** Not present  
**Incisions:** Not present

### Smoothing:

**Pre-Use:** Not present  
**Use:** Present  
**Incidental:** Not present

### Loss:

**Broken Piece:** Not present  
**Nicks:** Present

### Retooling:

**Resharpener:** Not present  
**Repaired:** Not present

### Recent:

**Cleaned:** Not present  
**Reuse:** Not present  
**Curation:** Not present

**Description of Use-Wear Amount/Location:** Smoothed edges of bead from use with small worn nicks on upper edges of rolled under side and side opposite of seam as well as lower left side. Bead's edges are slightly bent inward. Seam of rolled over edge smoothed against rest of bead body.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact  
**Possible Manufacturing Method:** Folded over and cold hammered  
**Possible Shaping Method:** Cut from blank and rolled, boxy  
**Decorations Present:** Not present  
**Decoration Description (if present):**  
**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Irregularly cut  
**Shape of Rolled Over Seam Edge:** Irregular  
**Amount of Overlap of Seam Sides:** 91-180 degrees  
**Rolled Under Seam Edge:** Smoothed  
**Special Shape:** No special shape  
**Seam Alignment:** Flush  
**General Comments:**

**Reuse:** Not present  
**Curation:** Not present

**Description of Use-Wear Amount/Location:** Hole in lower half of rolled over side. Was present prior to shaping or may have been created post shaping by use or for decoration or attachment. Upper and lower edges are worn with worn nicks throughout. Striations along upper edge of side opposite of seam. Seam of rolled over edge smoothed against rest of bead body with some possible black material placed between this edge and the rolled under side in order to disguise the seam.

## Manufacturing Stage/Processes:

### Level of Manufacture:

Moderately refined  
manufactured artifact

### Possible Manufacturing Method:

Folded over and cold hammered

### Possible Shaping Method:

Cut from blank and rolled, boxy

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Square

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 51-75% of object

## Total Surface Area with

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

**Description of Use-Wear Amount/Location:** Edges smoothed from use. Polish on rolled over side. Striations/incisions running transversely across bead body, especially by seam edge of rolled over side. Small nick on lower edge of left side. Seam of rolled over edge smoothed against rest of bead body.

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Present

**Decoration Description (if present):** Striations/incisions running transversely across bead body,

especially by seam edge of rolled over side.

**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes;**

**M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 181-270 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

**Description of Use-Wear Amount/Location:** Punch pendant fragment repurposed as a bead? Two punches in bead - one in lower half of rolled over side and top half of side opposite seam. Edges are worn with recessed areas that are either worn nicks from use or were purposely manufactured to be the serpentine sides of a pendant. Seam edge of rolled over side looks to have been broken. Possible incisions/striations running longitudinally along bead body throughout, but especially across seam edge.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Finely manufactured artifact  
**Possible Manufacturing Method:** Folded over and cold hammered  
**Possible Shaping Method:** Folded  
**Decorations Present:** Present

**Decoration Description (if present):** Possible incisions/striations running longitudinally along bead body

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

**Comments:**

**Bead Edges:** Irregularly cut  
**Shape of Rolled Over Seam Edge:** Squared  
**Amount of Overlap of Seam Sides:** 1-90 degrees  
**Rolled Under Seam Edge:** Smoothed  
**Special Shape:** No special shape  
**Seam Alignment:** Flush  
**General Comments:** Punch pendant fragment repurposed as a bead? Has two punches and edges almost look serpentine.

throughout, but especially across seam edge.

**Cross-Section Shape:** Polygonal

**Seam Alignment:** Flush

**General Comments:**

# Artifact: B72-144

Recorder: JMP

Date: 5/20/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 10.45mm  
Seam: 8.36mm  
Side Opposite Seam:  
9.85mm

## Width:

Maximum: 3.71mm  
Top Orifice: 2.56mm  
Bottom Orifice: 2.43mm

## Thickness:

Rolled Over Side: 0.37mm  
Side Opposite Seam: 0.81mm

Weight: 0.3g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 26-50% of object

**Type C:** Present on 1-25% of object

**Location of Patina/Corrosion:** Type A and accretions throughout.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 51-75% of object

**Pitting:** Present on 51-75% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

**Smoothing:**

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

**Loss:**

**Broken Piece:** Not present

**Nicks:** Present

**Retooling:**

**Resharpener:** Not present

**Repaired:** Not present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges slightly worn with some nicks. Top edge of left side is splayed outward. Incisions/striations running transversely across body of side opposite seam and rolled under side. Some incisions running longitudinally near center of right side and side opposite seam. Seam of rolled over edge smoothed against rest of bead body.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Cross-Section Shape:** Square

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Cut

from blank and rolled, boxy

**Decorations Present:** Present

**Decoration Description (if present):** Some incisions running longitudinally near center of right side and side opposite seam.

**Organic Residue Present? (Y =**

**Yes; M = Maybe; N = No):** M - on interior?

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:**

Squared

**Amount of Overlap of Seam Sides:**

91-180 degrees

**Rolled Under Seam Edge:**

Indeterminate

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:**

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Object has large gap between break that is roughly 2mm wide and runs transversely across bead body. There is also a small attached piece next to this gap and may be a portion of the rolled over side, though it cannot be certain. Edges are worn and slightly bent inward. Some irregular incisions near one edge of gap, probably not decorative. This area also has some slight polish.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Triangular

Organic Residue Present? (Y = Yes; M = Maybe; N = No): N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** 5

**Amount of Overlap of Seam Sides:**

Seam sides not touching

**Rolled Under Seam Edge:**

Indeterminate

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:** Object has large gap between break that is roughly 2mm wide and runs transversely across bead body. There is also a small attached piece next to this gap and may be a portion of the rolled over side, though it cannot be certain.

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges are worn, especially top right edge which is extremely worn down.

Cracks on surface, probably from fold over hammered manufacturing. Some irregular incisions on rolled under side that do not seem intentional enough to be decorative. Some possible polish on rolled under side.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

### Possible Manufacturing

**Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, smooth

**Decorations Present:** Not present

## Decoration Description (if present):

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam**

**Edge:** Irregular

**Amount of Overlap of Seam**

**Sides:** 1-90 degrees

**Rolled Under Seam Edge:**

Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:** Rolled over side is pinched on very end of seam edge like rolled under seam often looks like.

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges are smoothed with some polish. Upper edge of rolled over side has been worn down slightly. Polish and cross-hatched incised designs on rolled over side and right side. Rest of surface has accretions, but appears to also have striations and/or incisions. Seam of rolled over edge smoothed against rest of bead body.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:**

Present

**Decoration Description (if present):** Polish and cross-hatched incised designs on rolled over side and right side. Rest of surface has accretions, but appears to also have striations and/or incisions.

**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam**

**Edge:** Tapered

**Amount of Overlap of Seam**

**Sides:** 91-180 degrees

**Rolled Under Seam Edge:**

Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges are worn with some nicks, especially on lower left edge. Large crack stemming from upper right edge and running transversely toward center. This crack also has some loss around it. Cracks near rolled over seam edge. Possible material put between seam edge of rolled over side and rolled under sides to smooth over seam and make it less visible, though this is difficult to determine with surface corrosion.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

**Comments:**

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Indeterminate

**General Comments:**

**Special**

**Shape:** No special shape

**Seam**

**Alignment:** Flush

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Rolled over and under seam edges possibly broken off. Only lower half of rolled over seam edge overlapped with rolled under side. Rolled under side edge slightly bent. Large crack and loss on lower edge on side opposite seam.

Edges are worn with worn nick on lower edge of rolled under side. Body of bead is boxy and may be bent inward in some locations.

**Type A:** Present on 76-100% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 51-75% of object

**Location of Patina/Corrosion:** Type A and C throughout with some accretions.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 26-50% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Not present

**Striations:** Present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Edges smoothed. Possible striations running transversely across entire bead body. Small crack stemming from seam near lower edge of rolled under side.

### Smoothing:

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Not present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

## Manufacturing Stage/Processes:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing**

**Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Not present

**Decoration Description (if present):**

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam**

**Edge:** Tapered

**Amount of Overlap of Seam**

**Sides:** 181-270 degrees

**Rolled Under Seam Edge:**

Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

**Cross-Section Shape:** Oval

# Artifact: B72-176

Recorder: JMP

Date: 5/22/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 11.85mm  
Seam: 10.76mm  
Side Opposite Seam:  
11.01mm

## Width:

Weight: 1g

## Patina:

**Type A:** Present on 51-75% of object  
**Type B:** Present on 26-50% of object  
**Type C:** Present on 1-25% of object  
**Type D:** Present on 51-75% of object  
**Type E:** Not present

**Accretions:** Present on 76-100% of object  
**Pitting:** Present on 76-100% of object

**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Accretions throughout with some Type A and B.

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present  
**Cracking:** Present  
**Bending:** Not present

**Striations:** Present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Most of surfaces covered in accretions including upper bead edge. lower edge is slightly worn and has some polish on left side and side opposite seam. Possible polish on rolled over side. Crack stemming transversely from lower edge to center of bead on right side. Surface possibly has striations/incisions, but is difficult to determine with accretions.

### Smoothing:

**Pre-Use:** Not present  
**Use:** Present  
**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Description of Use-Wear Amount/Location:** Edges are smoothed and have cracked/layered appearance. Upper bead edge of rolled under side has large nick. Lower bead edge is bent slightly inward, especially piece of material that is separated by two significant worn nicks. Either piece of material on the lower bead edge of the right side from was broken and bent perpendicularly to bead edge or this material on the interior of this edge is the pinched end of the rolled under seam. Polish on upper half of side opposite seam. Striations running longitudinally along entire bead body. Cracks along seam edge, rolled over side, and right side, probably from fold over hammered manufacturing.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**General Comments:**

# Artifact: B72-186

Recorder: JMP

Date: 5/22/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 9.67mm  
Seam: 7.9mm  
Side Opposite Seam:  
9.56mm

## Width:

Maximum: 5.97mm  
Top Orifice: 3.55mm  
Bottom Orifice: 3.64mm

## Thickness:

Rolled Over Side: 0.66mm  
Side Opposite Seam: 0.64mm

Weight: 0.7g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 51-75% of object

**Type C:** Present on 26-50% of object

**Location of Patina/Corrosion:** Types A and B throughout with accretions. Type C mostly along edges.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 51-75% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges worn and lower edge has some polish. Upper edge of rolled under side is worn down. Polish on bead body on each side. Three incisions running longitudinally along most of bead's body. Some striations running transversely across bead body. Seam of rolled over edge smoothed against rest of bead body with some possible material placed between this edge and the rolled under side in order to disguise the seam.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:**

Cut from blank and rolled, boxy

**Decorations Present:**

Present

**Decoration Description (if present):** Three incisions

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):**

N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam**

Edge: Squared

**Amount of Overlap of Seam**

Sides: 91-180 degrees

**Rolled Under Seam Edge:**

Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

running longitudinally along most of bead's body.

**Cross-Section Shape:** Square

Morphofunctional Designation: Bead

## Length:

Full: 8.76mm  
Seam: 8.45mm  
Side Opposite Seam:  
8.31mm

## Width:

Maximum: 4.23mm  
Top Orifice: 3.41mm  
Bottom Orifice: 2.26mm

## Thickness:

Rolled Over Side: 0.38mm  
Side Opposite Seam: 0.61mm

Weight: 0.3g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 76-100% of object

**Location of Patina/Corrosion:** Types A and C throughout with some accretions.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 26-50% of object

**Pitting:** Present on 51-75% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Present

**Incisions:** Present

**Description of Use-Wear Amount/Location:** Edges are smoothed and bent inwards with worn nicks in corners of bead's boxy shape. Polish on right side. Striations and incisions throughout surface but corrosion make them difficult to observe.

### Smoothing:

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Cross-Section Shape:** Triangular

### Possible Manufacturing

**Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Present

**Decoration Description (if present):** Striations and incisions throughout surface but corrosion make them difficult to observe.

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** M - on interior?

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Tapered

**Amount of Overlap of Seam**

**Sides:** 1-90 degrees

**Rolled Under Seam Edge:**

Indeterminate

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

**Description of Use-Wear Amount/Location:** Edges are smoothed and bent slightly inwards. Upper bead edge may have some polish. Seam of rolled over edge smoothed against rest of bead body with some possible black material placed between this edge and the rolled under side in order to disguise the seam. Three incisions running longitudinally across right side and two running longitudinally across side opposite seam and left side. Possible striations running transversely across bead body.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Not present

**Description of Use-Wear Amount/Location:** Bead is distorted and it is difficult to determine original shape. Edges are smoothed with some polish. Two cracks perpendicular to top edge separated piece of material on top edge of rolled under side that was bent inward and surrounding areas were bent on top of. Right side's upper edge also bent inward. Lower two-thirds of bead bulged outward. Another two cracks stemming perpendicularly from lower edge of rolled under side and separated portion, surrounding areas to this portion were bent inward with the separated portion bent on top of. Polish on entire bead. Incisions/striations running longitudinally across entire bead body. Possibly repaired piece in prehistory?

## Manufacturing Stage/Processes:

**Special Shape:** No special  
shape

**Seam Alignment:** Flush

**General Comments:**

# Artifact: B72-217

Recorder: JMP

Date: 5/23/2016

**Reported Provenience:** Crabapple Point, Bussey Collection

**Morphofunctional Designation:** Bead

**Length:**

Full: 8.02mm  
Seam: 5.76mm  
Side Opposite Seam:  
8.01mm

**Width:**

Maximum: 7.11mm  
Top Orifice: 5.28mm  
Bottom Orifice: 4.78mm

**Thickness:**

Rolled Over Side: 0.38mm  
Side Opposite Seam: 0.85mm

**Weight:** 0.5g

**Patina:**

**Type A:** Present on 51-75% of object  
**Type B:** Present on 26-50% of object  
**Type C:** Present on 26-50% of object  
**Type D:** Present on 1-25% of object  
**Location of Patina/Corrosion:** Accretions throughout with Type A.

**Type E:** Not present  
**Accretions:** Present on 76-100% of object  
**Pitting:** Present on 51-75% of object

**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

**Manufacturing Marks and/or Use-Wear:**

**Stress Damage:**

**Mushrooming/Splaying:** Present  
**Cracking:** Present  
**Bending:** Present  
**Striations:** Present  
**Incisions:** Present  
**Smoothing:**

**Pre-Use:** Present

**Use:** Present  
**Incidental:** Not present  
**Loss:**  
**Broken Piece:** Not present  
**Nicks:** Present  
**Retooling:**

**Resharpener:** Not present

**Repaired:** Not present  
**Recent:**  
**Cleaned:** Not present  
**Reuse:** Not present  
**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges are smoothed and bent slightly inward. Upper edge has some polish. Lower edge of rolled under side has nick and crack. Additional worn cracks on lower edge. Upper right edge has small nick. Seam edge of rolled under side is slightly splayed from bead body and has a "warped" appearance. Some incisions/striations running diagonally from seam edge of rolled over side and is accompanied with some polish. Some cracks and polish on rolled under side.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact  
**Possible Manufacturing Method:** Folded over and cold hammered  
**Possible Shaping Method:** Cut from blank and rolled, boxy  
**Decorations Present:** Present

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

**Comments:**

**Bead Edges:** Irregularly cut  
**Shape of Rolled Over Seam Edge:** Irregular  
**Amount of Overlap of Seam Sides:** 181-270 degrees  
**Rolled Under Seam Edge:** Smoothed  
**Special Shape:** Globular  
**Seam Alignment:** Flush  
**General Comments:**

**Decoration Description (if present):** Some incisions/striations running diagonally from seam edge of rolled over side.

**Cross-Section Shape:** Polygonal

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Present

**Incisions:** Not present

### Smoothing:

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges smoothed with numerous small nicks and upper edge of side opposite seam has worn nick in center. Bead possibly squished after manufacture with seam side and side opposite seam being pressed closer together. Seam edge of rolled over side has some incisions running transversely near edge, possibly an attempt to smooth seam against rest of bead body. Possible striations running longitudinally across entire bead body.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

### Possible Manufacturing

**Method:** Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Not present

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Squared

**Amount of Overlap of Seam**

**Sides:** 181-270 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

**Decoration Description (if present):**

**Cross-Section Shape:** Oval

**Description of Use-Wear Amount/Location:** Edges worn with possible polish. Seam of rolled over edge smoothed against rest of bead body. Possible incisions/striations running longitudinally along bead's body, especially along rolled over side's seam edge. Side opposite seam may have some transverse striations. Some cracks on surface, mostly running along edges. Possible polish on rolled over side.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Present

**Decoration Description (if present):** Possible incisions/striations running longitudinally along bead's body,

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Tapered

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

especially along rolled over side's seam edge.

**Cross-Section Shape:** Oval

Full: 15.08mm  
Seam: 11.86mm  
Side Opposite Seam:  
13.86mm

## Width:

Maximum: 6.08mm  
Top Orifice: 3.98mm  
Bottom Orifice: 3.56mm

## Thickness:

Rolled Over Side: 0.64mm  
Side Opposite Seam: 0.65mm

Weight: 0.6g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 26-50% of object

**Type C:** Present on 51-75% of object

**Location of Patina/Corrosion:** Types A and C throughout with accretions.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 51-75% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Present

**Incisions:** Not present

### Smoothing:

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges smoothed with significant losses. Upper edge has large losses on right side and side across seam. Lower edge has large losses on right and left sides and rolled under side. Possible striations running longitudinally along entire bead body. Polish on side opposite seam. Body of bead slightly distorted and bent inward.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Polygonal

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** M - caught between layers of bead's rolled under and rolled over sides?

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 360+ degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

Artifact: B72-250

Recorder: JMP Date: 5/24/2016

**Reported Provenience:** Crabapple Point, Bussey Collection

**Morphofunctional Designation:** Bead

**Length:**

Full: 13.21mm  
Seam: 10.16mm  
Side Opposite Seam:  
11.5mm

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges worn. Lower edge has possible polish and nick on side opposite seam. Worn nick on right side of upper edge. Seam of rolled over edge smoothed against rest of bead body with some possible black material placed between this edge and the rolled under side in order to disguise the seam. Lower left side has large dent. Incisions running transversely across seam edge on both rolled under and over sides. Side opposite seam has cross-hatched incisions. Cracks on right side.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Present

**Decoration Description (if present):** Incisions running transversely across seam edge on both rolled under and over sides. Side opposite seam has cross-hatched incisions.

**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:**

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Squared

**Amount of Overlap of Seam**

**Sides:** 91-180 degrees

**Rolled Under Seam Edge:**

Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

running longitudinally along bead body throughout sporadically.

**Cross-Section Shape:** Triangular

Artifact: B72-270

Recorder: JMP Date: 5/25/2016

**Reported Provenience:** Crabapple Point, Bussey Collection

**Morphofunctional Designation:** Bead

**Length:**

Full: 11.95mm  
Seam: 11.68mm  
Side Opposite Seam:  
10.97mm

**Width:**

Maximum: 4.01mm  
Top Orifice: 1.36mm  
Bottom Orifice: 1.56mm

**Thickness:**

Rolled Over Side: 0.46mm  
Side Opposite Seam: 0.63mm

**Weight:** 0.6g

**Patina:**

**Type A:** Present on 1-25% of object

**Type B:** Present on 1-25% of object

**Type C:** Not present

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 1-25% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Thick accretions throughout that have a slight green tint to them.

**Manufacturing Marks and/or Use-Wear:**

**Stress Damage:**

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

**Smoothing:**

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

**Broken Piece:** Not present

**Nicks:** Not present

**Retooling:**

**Resharpener:** Not present

**Repaired:** Not present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges are smoothed with polish. Striations running transversely across rolled over side. Incision along bottom edge of rolled under side which appears to be a mistake from cutting the blank.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:**

Possibly cut from copper or brass kettle

**Possible Shaping Method:** Folded

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

**Comments:**

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:**

Squared

**Amount of Overlap of Seam Sides:** 91-180 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:** Brass? Possibly a very small tinkler cone?

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

**Description of Use-Wear Amount/Location:** Edges smoothed. Upper edge has numerous nicks and very large loss beginning on left side and extending to rolled under side. Tab of material on broken top edge is bent inward. Seam of rolled over edge smoothed against rest of bead body. A couple of incisions and striations running longitudinally along entire bead near center.

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Seam Alignment:** Flush

**General Comments:**

# Artifact: B72-282

Recorder: JMP

Date: 5/25/2016

**Reported Provenience:** Crabapple Point, Bussey Collection

**Morphofunctional Designation:** Bead

## Length:

Full: 9.97mm  
Seam: 4.26mm  
Side Opposite Seam:  
9.67mm

## Width:

Maximum: 8.91mm  
Top Orifice: 4.59mm  
Bottom Orifice: 3.23mm

## Thickness:

Rolled Over Side: 1.47mm  
Side Opposite Seam: 0.97mm

**Weight:** 1.4g

## Patina:

**Type A:** Present on 51-75% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 1-25% of object

**Type D:** Present on 26-50% of object

**Location of Patina/Corrosion:** Thick accretions throughout with some Type A.

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 51-75% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Present

**Incisions:** Present

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges are smoothed and bent inward. Nick in center of rolled over side's seam edge. Striations running longitudinally on all sides except rolled under side. Right side has longitudinal incisions. Rolled under side has incisions stemming from upper edge. Bead appears to be very distorted or was created with less refined methods. Left side appears to be bent inwards. Cracks on left side with one section separated by a crack splayed from the rest of the bead body.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Present

**Decoration Description (if present):**

Right side has longitudinal incisions.

Rolled under side has incisions stemming from upper edge.

**Cross-Section Shape:** Polygonal

**Organic Residue Present? (Y = Yes;**

**M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:**

Tapered

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:**

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges smoothed. Lower edge has possible large loss on rolled under side and side opposite seam is slightly bent inward. Upper edge has potential loss on rolled over and rolled under side, as well as a worn nick in center of side opposite seam. Right portion of side opposite seam is splayed slightly outward and has small crack on right side of this portion. Crack through rolled under side at thinnest point with small hole near lower edge. Cracks in rolled over side and right side.

**Manufacturing Stage/Processes:**

**Level of Manufacture:**

Moderately refined  
manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Cut

from blank and rolled, boxy

**Decorations Present:** Not present

## Thickness:

Rolled Over Side: 0.55mm  
Side Opposite Seam: 0.78mm

Weight: 2.4g

## Patina:

**Type A:** Present on 51-75% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 76-100% of object

**Type D:** Present on 1-25% of object

**Location of Patina/Corrosion:** Types A and C and accretions throughout.

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 76-100% of object

## Total Surface Area with

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Not present

**Striations:** Not present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Edges smoothed with worn nicks, especially on upper left and rolled under side and corner of rolled over side. Cracks on surface, probably from folded over hammered manufacturing.

### Smoothing:

**Pre-Use:** Not present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

## Manufacturing Stage/Processes:

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Square

**Organic Residue Present? (Y = Yes;**

**M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Irregularly cut

**Shape of Rolled Over Seam Edge:** Squared

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Pinched

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:** Seam edges just touching with one side slightly on top of the other.

# Artifact: B72-293

Recorder: JMP

**Description of Use-Wear Amount/Location:** Edges smoothed. Lower edge has possible polish. Upper edge has nick in rolled over side. Right lower edge bent slightly inward. Bead surface is very irregular and this surface was either intentionally created with pressure from a tool or was made with less refined techniques. Surface around seam is especially rough. Longitudinal striations running along bead body on seam and corners. Rolled under side has a crack running transversely from upper edge and stemming to center of body.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Folded

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Triangular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

**Comments:**

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 1-90 degrees

**Rolled Under Seam Edge:** Pinched

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:**

# Artifact: B72-303

Recorder: JMP

Date: 5/25/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Bead

## Length:

Full: 25.24mm  
Seam: 23.29mm  
Side Opposite Seam:  
24.12mm

## Width:

Maximum: 8.42mm

Bottom Orifice: 6.46mm

## Thickness:

Rolled Over Side: 1.01mm  
Side Opposite Seam: 1.03mm

Weight: 3.1g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 51-75% of object

**Type C:** Present on 1-25% of object

**Location of Patina/Corrosion:** Type A and accretions throughout.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Present

**Incisions:** Present

**Description of Use-Wear Amount/Location:** Edges smoothed with possible polish. Portion of upper edge on left side is bent inward. Lower edge also bent inward at center of rolled under side. Lower edge of rolled under side bent inward as well. Diagonal striations/incisions throughout. Polish throughout body.

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Not present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, boxy

**Decorations Present:** Present

**Decoration Description (if present):**

Diagonal striations/incisions throughout.

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:** Irregular

**Amount of Overlap of Seam Sides:** 181-270 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Flush

**General Comments:** Brass?

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present  
**Cracking:** Present  
**Bending:** Present  
**Striations:** Not present  
**Incisions:** Present

### Smoothing:

**Pre-Use:** Present  
**Use:** Present  
**Incidental:** Not present  
**Loss:**  
**Broken Piece:** Not present  
**Nicks:** Present

### Retooling:

**Resharpener:** Not present  
**Repaired:** Not present  
**Recent:**  
**Cleaned:** Not present  
**Reuse:** Not present  
**Curation:** Not present

**Description of Use-Wear Amount/Location:** Edges worn with some nicks. Lower edge has some polish. Bead was squished probably after manufacture with seam edge and side opposite seam being pushed together. Crack on upper half of rolled under side. Wide incisions/divots running longitudinally throughout bead's body. Seam of rolled over edge slightly smoothed against rest of bead body and has divots along its edge and some polish.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured artifact  
**Possible Manufacturing Method:** Folded over and cold hammered  
**Possible Shaping Method:** Folded

**Decorations Present:** Present  
**Decoration Description (if present):** Wide incisions/divots running longitudinally throughout bead's body.  
**Cross-Section Shape:** Oval

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** N

## Comments:

**Bead Edges:** Cleanly cut  
**Shape of Rolled Over Seam Edge:** Irregular  
**Amount of Overlap of Seam Sides:** 1-90 degrees  
**Rolled Under Seam Edge:** Smoothed  
**Special Shape:** No special shape  
**Seam Alignment:** Askew  
**General Comments:**

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Thick black accretion on lower edge of rolled under side and extending to lower edge of side opposite seam. Lower edge is worn with flakey appearance of edge and one small section bent inward on side opposite seam. Slight bend inward on each side of the lower bead edge. Top edge is also worn with flakey appearance of edge. Rolled over seam edge is very precisely smoothed against rolled under seam edge. Surface appears to have some ripples from hammering, but also appears to have striations that run transversely across bead's body throughout.

**Manufacturing Stage/Processes:**

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and rolled, smooth

**Decorations Present:** Not present

**Decoration Description (if present):**

**Organic Residue Present? (Y = Yes; M = Maybe; N = No):** Y

**Comments:**

**Bead Edges:** Cleanly cut

**Shape of Rolled Over Seam Edge:**  
Tapered

**Amount of Overlap of Seam Sides:**  
181-270 degrees

**Rolled Under Seam Edge:** Smoothed

**Special Shape:** No special shape

**Seam Alignment:** Askew

**General Comments:** Thick black accretions possibly a pitch-like substance?

**Cross-Section Shape:** Oval

**APPENDIX E:**  
**PENDANTS OF THE CRABAPPLE POINT, CRESCENT BAY HUNT CLUB,**  
**SCHMELING, AND KOSHKONONG CREEK VILLAGE SITES**

**Description of Use-Wear Amount/Location:** One intact punch and one loss that looks like a notch now but could have been originally a punch that later broke. Edges are rounded and flat edge opposite attachment could be broken or worn. There may be slight striations running transversely on the tip of this edge on left side (with concave side of punctate) and the right side has flakey steps that could indicate breakage. Slight dent near punch and is concave on same side that punch is concave. Striations run across entire pendant transversely on side with concave punch, but on opposite side they run longitudinally throughout.

### Manufacturing Stage/Process:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and punched

**Decorations Present:** Not present

**Decoration Description (if present):** Not present

Description of Use-Wear Amount/Location: Ends possibly broken? One end is rounded and slightly splayed and other edge is irregular with one corner slightly splayed and twisted. Probably manufactured by folded over and hammering layers since one layer is clearly visible. This object also could have been tubular at one point in time, and has the form of a crescent-shaped bead that wasn't fully closed. Edges are rounded. Line of smoothed wear running transversely across object close to rounded edge, possible wear from being wrapped with a cord.

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Not present

**Incisions:** Present

**Description of Use-Wear Amount/Location:** Edges appear to be slightly worn and have a couple of small nicks. Notches on thicker end appear to have been made by cutting out small sections on each side. There appears to be cross-hatched incised decorations, at least on one side, but patina and corrosion make the surface difficult to discern.

Patina/Corrosion: Present on 76-100% of object

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

Mushrooming/Splaying: Not present

Cracking: Not present

Bending: Not present

Striations: Present

Incisions: Not present

Description of Use-Wear Amount/Location: Slight bend along edges may indicate that this piece was cut from a larger blank. On side where punch is concave, there is a impressed line following concave end that is about a millimeter wide. On opposite side on same edge, there is slight discoloration and polish. Possibly resharpened?

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

**Description of Use-Wear Amount/Location:** Punch is broken on top edge. Looks like pendant was scraped twice on the lower half of one side by a sizeable tool that had an irregular edge. Edges are slightly worn and flaked and top edge has some polish. Crack and small nick near pointed end. Surface might have been incised with cross-hatched design on both sides, but accretions and patina make it difficult to observe.

Description of Use-Wear Amount/Location: Attachment end is rounded, but has notch that is either damage or this end was cut into a bifurcated shape or it was another punch that had been broken. Edges are worn with some nicks and somewhat flakey. One side has polish along edge. Surface is flakey with some cracks and has very thick accretions.

## Manufacturing Stage/Process:

Level of Manufacture: Moderately refined manufactured artifact

Possible Manufacturing Method: Folded over and cold hammered

Possible Shaping Method: Cut from blank and punched

Decorations Present: Not present

Decoration Description (if present): Not present

Cross-Section Shape: Flat

Organic Residue Present? (Y= Yes; M=

Maybe; N = No): N

## Comments:

Attachment Type: Punched

Pendant Shape: Serpentine

Attachment/Larger End Shape: Rounded

End Opposite of Attachment Shape: Tapered

General Comments: Attachment end is rounded, but has notch that is either damage or this end was cut into a bifurcated shape or it was another punch that had been broken. Made from a material other than copper, like brass, or has a high concentration of iron?

**Description of Use-Wear Amount/Location:** Beginnings of punch near one end. Appears that tool used to punch holes was a tight crescent shape. Edge closest to punch may have been broken, but appears to have been made in a slightly irregular square shape or could have been a broken pendant that was in the middle of being repaired. Significant nick with exfoliated layers and cracks sprawling out from it on lower edge. Polish on both edges. Both edges have cross-hatched incisions on most of body with transverse incisions on lower third of pendant near tapered edge.

Description of Use-Wear Amount/Location: Pendant seems to have been smoothed after manufacture. Both sides have significant incised decorations. Each side has a border of cross-hatched triangles and at least one side has additional incised decorations in center of circle. Slight wear and small nicks along edges. Two small divots on end opposite punch.

## Manufacturing Stage/Process:

### Level of Manufacture:

Finely manufactured artifact

Possible Manufacturing Method: Folded over and cold hammered

Possible Shaping Method: Cut from blank and punched

Decorations Present: Present

Decoration Description (if present): Present

Cross-Section Shape: Flat

Accretions: Present on 76-100% of object

Pitting: Present on 76-100% of object

Total Surface Area with Patina/Corrosion: Present on 76-100% of object

Location of Patina/Corrosion: Thick accretions and pitting throughout.

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

Mushrooming/Splaying: Not present

Cracking: Present

Bending: Present

Striations: Not present

Incisions: Not present

Description of Use-Wear Amount/Location: Thick accretions throughout make it difficult to discern surface. Crease extending across center of punch could be from spot where pendant was previously bent and then bent back either prehistorically or by Mr. Bussey. Similar crease mark in one of upper corners. One portion of lower side has slight polish.

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Present

**Description of Use-Wear Amount/Location:** End opposite punch has numerous large nicks that have removed a portion of this edge. Cracks appear transversely across the piece and may indicate the pendant may have been bent at one point in time and was repaired in prehistory or by Mr. Bussey. Edges are slightly worn with a couple of small nicks. Both sides may have a slight polish. Both sides appear to have some incisions/striations, though the extent to this possible decoration is difficult to determine due to surface corrosion.

## Manufacturing Stage/Process:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank and punched

**Decorations Present:** Possibly present

**Decoration Description (if present):** Possibly present

**Cross-Section Shape:** Flat

**Organic Residue Present? (Y= Yes; M= Maybe; N = No):** N

## Comments:

**Attachment Type:** Punched

**Pendant Shape:** Other

**Attachment/Larger End Shape:** Squared/Flat

**End Opposite of Attachment Shape:** Rounded

**General Comments:** Similar to sword shape with its rounded end with pointed sides, but does not have the top appendages close to the punch like other pendants of this type.

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Both ends broken. Edges slightly worn with small nicks. One side appears to have striations/incisions running diagonally across surface and opposite side appears to have incisions/striations running longitudinally. Crack on one side of pendant fragment appears to be from fold over manufacturing.

## Manufacturing Stage/Process:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank

**Decorations Present:** Possibly present

**Decoration Description (if present):** Possibly present

**Cross-Section Shape:** Flat

## Organic Residue Present?

(Y= Yes; M= Maybe; N = No)  
N

## Comments:

### Attachment Type:

Attachment not present or indistinguishable

**Pendant Shape:** Serpentine

**Attachment/Larger End**

**Shape:** Broken

**End Opposite of**

**Attachment Shape:** Broken

### General Comments:

Probably related to B70-54, though the widths of the ends where pieces would align are off by about 2mm so they were not associated as two halves of the same piece at this time.

**Description of Use-Wear Amount/Location:** Straight edge has ripples running perpendicularly to it or this wear might be wide incisions on both sides. Possible striations on both sides, but accretions and pitting make this difficult to discern. Two corners are bent in the same direction. Edge opposite straight edge has a large crack running perpendicular to the edge. Some wear on each of the longer edges with some nicks. Straight edge possibly broken edge? Cracks over side with label, possibly from fold over hammered manufacturing.

### Manufacturing Stage/Process:

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping**

**Method:** Cut from blank

**Decorations**

**Present:** Not present

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Edges are smoothed with some small flaking/nicks, probably from manufacture and wear. Attachment is bent flat into body and there is a small crack running halfway up the rolled over attachment section. Side opposite attachment is very flat, which indicates that this object was probably manufactured by hammering it on a smooth surface. Incision near edge by pendant head may be a mistake from manufacture.

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Four significant bends traversing pendant's body, with some cracks having formed along these bends. At one bend, it looks like a tool may have been scraped across the section to create a wide, shallow indentation running across pendant body - possible indicator that this piece was intentionally damaged. Edges appear to be worn and have some possible areas of worn nicks, especially along very top edge of head and end opposite of head. Possible striations running longitudinally along body on side where bends are convex and some possibly running transversely across body on side where bends are concave.

### Manufacturing Stage/Process:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:**

Cut from blank and punched

**Decorations Present:** Possibly present

**Decoration Description (if present):** Possibly present

#### Stress Damage:

**Mushrooming/Splaying:** Present

**Cracking:** Present

**Bending:** Present

**Striations:** Not present

**Incisions:** Present

**Smoothing:**

**Description of Use-Wear Amount/Location:** One corner has a sharp bend and is made of multiple layers that have been separated. One longer edge is very smooth and seems that it was shaped into a serpentine form. Running perpendicular to the edge with flared corner on the opposite face is a deeper impression possibly from a finer hammer or larger incising tool. On the longer side with the bent up corner near the corner opposite of this flared portion is a deeper incision. Cracks and slight separation appear throughout the body of the piece, which is a signature of fold over hammered manufacturing.

Description of Use-Wear Amount/Location: Incisions along base and one side of pendant on side where the punch is concave. Edges are slightly flared upward away from side with splayed out portion of punch. On side with splayed out punch, the upper portion (away from the triangle's base) has a deep, grooved incision that could have possibly been made by being scraped with a stone tool? One corner either was broken off or cut differently than other during manufacture.

### Manufacturing Stage/Process:

Level of Manufacture: Finely manufactured artifact

Possible Manufacturing Method: Possibly cut from copper or brass kettle

Possible Shaping

Method: Cut from blank and punched

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Not present

**Striations:** Present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Very smooth and neatly made. One end is smoothed flat, but center of end is smoothed or impressed inward slightly. The opposite end is diagonal and looks like it was cut with by something that required some force, such as a sharp stone tool, metal knife, or scissors. Striations running transversely across entire piece.

### Smoothing:

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

**Nicks:** Not present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curator:** Not present

## Manufacturing Stage/Process:

**Level of Manufacture:** Finely manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Ground

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Circular

**Organic Residue Present? (Y= Yes;**

**M= Maybe; N = No):** N

## Comments:

**General Shape:** Oval

**Possible Intended Final Form:**

Other

**General Comments:** Copper rod cut with a scissors? Very smooth and neatly made. Possibly a prepped item for trade? Noted in the fragment section.

## Artifact: BSB-3

Recorder: JMP Date: 6/13/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Fragment

Length: 20.29mm

Width: 11.44mm

Thickness: 0.86mm

Weight: 0.7g

### Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 26-50% of object

**Type C:** Present on 51-75% of object

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Smallest end broken off and has irregular edge. Half of the fragment's body closest to this broken edge is bent with three creases/cracks. On both sides, incisions run longitudinally along longest portion of fragment. With some incisions running along widest edge. Incisions on convex side are slightly deeper. One long edge is slightly thinned with thinning starting about 1.5 mm from edge. Edges are lightly worn with some nicks.

### Manufacturing Stage/Process:

#### Level of Manufacture:

Finely manufactured artifact

#### Possible Manufacturing

**Method:** Folded over and cold hammered

#### Possible Shaping Method:

Cut from blank

#### Decorations Present:

Possibly present

#### Decoration Description (if present):

On both sides, incisions run longitudinally along longest portion of fragment. With some incisions running along widest edge. Incisions on convex side are slightly deeper.

**Cross-Section Shape:** Flat

### Organic Residue Present? (Y=

Yes; M= Maybe; N = No): N

### Comments:

**General Shape:** Polygonal

**Possible Intended Final**

**Form:** Indeterminate

#### General Comments:

Possible pendant fragment or blank for bead?

## Artifact: BSB-6

### Manufacturing

#### Stage/Process:

##### Level of Manufacture:

Some modification

##### Possible Manufacturing

**Method:** Folded over and cold hammered

##### Possible Shaping

**Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Flat

### Organic Residue Present?

(Y= Yes; M= Maybe; N = No): N

### Comments:

**General Shape:** Oval

**Possible Intended Final**

**Form:** Indeterminate

**General Comments:**

## Artifact: BSB-18

Recorder: JMP Date: 9/28/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Fragment

Length: 37.07mm

Width: 35.48mm

Thickness: 2.56mm

Weight: 11.3g

### Patina:

**Type A:** Present on 76-100% of object

**Type D:** Present on 1-25% of object

**Pitting:** Present on 26-50% of object

**Type B:** Present on 1-25% of object

**Type E:** Present on 1-25% of object

**Total Surface Area with**

**Type C:** Present on 26-50% of object

**Accretions:** Present on 76-100% of object

**Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type A throughout with areas of Type C. Accretions throughout.

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

**Mushrooming/Splaying:** Present

**Cracking:** Present

**Bending:** Not present

**Striations:** Not present

**Incisions:** Not present

**Smoothing:**

**Description of Use-Wear Amount/Location:** Cracks on surface from layered fold-over-hammered manufacturing. Parts of layers are slightly splayed from main body.

**Pre-Use:** Not present

### Description of Use-Wear Amount/Location:

Piece is bent, splayed, and overall distorted. At center, the copper is exposed and appears to be a portion that was bent at one time and bent back leaving a crease. One side has some polish. One half of one side has deep incisions stemming from edges. Crack at center of piece near crease.

## Manufacturing Stage/Process:

**Level of Manufacture:** Some modification

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Flat

**Organic Residue Present? (Y= Yes; M= Maybe; N = No):** N

## Comments:

**General Shape:** Square

**Possible Intended Final Form:** Indeterminate

**General Comments:**

# Artifact: BSB-32

Recorder: JMP

**Present? (Y= Yes; M= Maybe; N = No):** N

## Comments:

**General Shape:** Oval  
**Possible Intended Final Form:** Other  
**General Comments:** Possible tool?

## Artifact: BSB-45

Recorder: JMP Date: 9/28/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Fragment

Length: 17.97mm

Width: 10.47mm

Thickness: 0.79mm

Weight: 0.5g

### Patina:

**Type A:** Present on 26-50% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 26-50% of object

**Type D:** Present on 1-25% of object

**Location of Patina/Corrosion:** Types A and C and accretions throughout.

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Flattened piece with one end rolled upward. Edges have some slight nicks. Possible striations running longitudinally on both sides. Possibly a bead being formed?

#### Smoothing:

**Pre-Use:** Present

**Use:** Not present

**Incidental:** Not present

#### Loss:

**Broken Piece:** Not present

**Nicks:** Present

#### Retooling:

**Resharpened:** Not present

**Repaired:** Not present

#### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

### Manufacturing Stage/Process:

**Level of Manufacture:** Moderately refined manufactured artifact

**Possible**

**Manufacturing**

**Method:**

Folded over and cold hammered

**Possible**

**Shaping**

**Method:** Cut

from blank and rolled, boxy

**Decorations**

**Present:** Not present

**Decoration**

**Description (if present):**

### Organic Residue

**Present? (Y= Yes;**

**M= Maybe; N =**

**No):** N

### Comments:

**General Shape:**

Triangular

**Possible**

**Intended Final**

**Form:** Bead

**General**

**Comments:**

**Cross-Section Shape:** Flat

# Artifact: BSB-46

Indeterminate

#### General

**Comments:**

About one millimeter of tip of smaller end broke and crumbled into tiny pieces during analysis.

## Artifact: BSB-76

Recorder: JMP Date: 9/28/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Fragment

Length: 20.1mm

Width: 6.05mm

Thickness: 1.55mm

Weight: 0.8g

### Patina:

Type A: Present on 1-25% of object

Type B: Present on 1-25% of object

Type C: Present on 1-25% of object

Type D: Present on 1-25% of object

Type E: Not present

Accretions: Present on 76-100% of object

Pitting: Present on 76-100% of object

Total Surface Area with

Patina/Corrosion: Present on 76-100% of object

Location of Patina/Corrosion: Thick accretions with some pitting throughout.

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

Mushrooming/Splaying: Not present

Cracking: Not present

Bending: Not present

Striations: Not present

Incisions: Not present

#### Smoothing:

Pre-Use: Not present

Use: Not present

Incidental: Not present

#### Loss:

Broken Piece: Not present

Nicks: Present

#### Retooling:

Resharpener: Not present

Repaired: Not present

#### Description of Use-Wear

Amount/Location: Possibly a crushed bead? Nicks along edges and one nick in corrosion of one side.

### Manufacturing Stage/Process:

Level of Manufacture: Roughly manufactured artifact

Possible Manufacturing Method:

Folded over and cold hammered

Possible Shaping Method:

Hammered

Decorations Present: Not present

Decoration Description (if present):

Cross-Section Shape: Flat

Organic Residue Present? (Y= Yes; M= Maybe; N = No): N

### Comments:

General Shape: Square

Possible Intended Final Form: Bead

General Comments: Possibly a crushed bead?

**General Comments:** Possibly the beginning of a bead or a hook-like tool? Length is total length of each bent portion added together.

# Artifact: BSB-87

Recorder: JMP Date: 9/28/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Fragment

Length: 18.22mm

Width: 3.76mm

Thickness: 2.11mm

Weight: 0.6g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 1-25% of object

**Location of Patina/Corrosion:** Type A throughout with some accretions.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 51-75% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

### Smoothing:

**Pre-Use:** Not present

**Use:** Not present

**Incidental:** Not present

### Loss:

**Broken Piece:** Not present

### Description of Use-Wear

**Amount/Location:** One end has a couple of crack stemming from it and the portion separated by the cracks is bent inward against the body of the fragment. Possibly a very small awl?

**Nicks:** Not present

### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

## Manufacturing Stage/Process:

**Level of Manufacture:** Some modification

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:**

Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Oval

Organic Residue Present? (Y= Yes;

M= Maybe; N = No): N

## Comments:

**General Shape:** Square

**Possible Intended Final Form:**

Awl

**General Comments:** Possibly a very small awl?

### Organic Residue Present?

(Y= Yes; M= Maybe; N =

No): N

### Comments:

**General Shape:**

Polygonal

**Possible Intended Final**

**Form:** Bead

**General Comments:**

Possibly a crushed bead?

# Artifact: BSB-101

Recorder: JMP Date: 9/28/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Fragment

Length: 17.65mm

Width: 10.74mm

Thickness: 0.5mm

Weight: 0.3g

## Patina:

Type A: Present on 51-75% of object

Type B: Present on 1-25% of object

Type C: Present on 51-75% of object

Type D: Present on 26-50% of object

Location of Patina/Corrosion: Types A and C and accretions throughout.

Type E: Not present

Accretions: Present on 76-100% of object

Pitting: Present on 51-75% of object

Total Surface Area with

Patina/Corrosion: Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

Mushrooming/Splaying: Not present

Cracking: Present

Bending: Present

Striations: Not present

Incisions: Not present

Description of Use-Wear Amount/Location: Cracks stemming from one edge that also has some bent portions. Object bent across piece widthwise. Possible polish in a couple of small areas on each side.

### Smoothing:

Pre-Use: Not present

Use: Not present

Incidental: Present

# Artifact: BSB-115

Recorder: JMP

Date: 9/28/2016

Reported Provenience: Crabapple Point, Bussey Collection

Morphofunctional Designation: Fragment

Length: 17.96mm

Width: 14.39mm

Thickness: 0.81mm

Weight: 0.9g

## Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type C and accretions throughout with some Type A.

**Type D:** Present on 26-50% of object

**Type E:** Present on 1-25% of object

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 51-75% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

**Description of Use-Wear Amount/Location:** Object bent at center and along one edge. Some nicks along edges.

### Smoothing:

**Pre-Use:** Not present

**Use:** Not present

Morphofunctional Designation: Fragment

Length: 18.58mm

Width: 5.24mm

Thickness: 0.38mm

Weight: 0.2g

### Patina:

**Type A:** Present on 51-75% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 1-25% of object

**Type D:** Present on 76-100% of object

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type D and accretions throughout with areas of Type A.

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Not present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

**Smoothing:**

**Pre-Use:** Not present

**Use:** Not present

**Incidental:** Not present

#### Loss:

**Broken Piece:** Not present

#### Description of Use-Wear

**Amount/Location:** At center, the copper is exposed and appears to be a portion that was bent at one time and bent back leaving a crease.

Portion of one end was bent backwards and smoothed against fragment body.

**Nicks:** Not present

**Retooling:**

**Resharpener:** Not present

**Repaired:** Present

#### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Present

### Manufacturing Stage/Process:

**Level of Manufacture:** Prepared blank

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Cut from blank

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Flat

**Organic Residue Present? (Y= Yes;**

**M= Maybe; N = No):** N

### Comments:

**General Shape:** Irregular

**Possible Intended Final Form:**

Indeterminate

Description of Use-Wear Amount/Location: Looks like piece was folded over and hammered a couple of times or was a rough bead/tinkler cone that was later smashed and heavily corroded. Edges are irregular and there may be incisions running across fragment. One edge slightly bent upward and cracks throughout.

**Description of Use-Wear Amount/Location:** One very rough broken edge that is slightly up curved. One tab that is sticking up is slightly pinched on its very end. Cracks running perpendicularly to this broken edge. All other edges are worn and some have striations running perpendicular to them. Opposite side has sharp edge and corner near broken edge, almost as if the object was pressed in a mold. Ripples running perpendicular to broken edge here.

## Manufacturing

### Stage/Process:

#### Level of Manufacture:

Moderately refined manufactured artifact

#### Possible Manufacturing

**Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Flat

### Organic Residue Present?

(Y= Yes; M= Maybe; N = No):

N

### Comments:

**General Shape:** Irregular

**Possible Intended Final**

**Form:** Pendant

**General Comments:** Noted as a fragment since this is the closest category for this piece. Possibly the end of a serpentine pendant? Or perhaps the start of a bead?

**Location of Patina/Corrosion:** Type A and B throughout with areas of Type D. Accretions are thick in some points.

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 76-100% of object

**Total Surface Area with Patina/Corrosion:** Present on 76-100% of object

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

**Mushrooming/Splaying:** Not present

**Cracking:** Present

**Bending:** Present

**Striations:** Present

**Incisions:** Not present

#### Smoothing:

**Pre-Use:** Not present

#### Description of Use-Wear

**Amount/Location:** Edges are irregular and long edges are slightly curved in the same direction. Possibly a bead that has broken in half? Cracks along edges and thick patina on interior, possibly from use? Flatter edges has dents/ripples running along it and may have some polish.

**Use:** Present

**Incidental:** Not present

#### Loss:

**Broken Piece:** Present

**Nicks:** Present

#### Retooling:

**Resharpener:** Not present

**Repaired:** Not present

#### Recent:

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

### Manufacturing Stage/Process:

**Level of Manufacture:** Roughly manufactured artifact

**Possible Manufacturing Method:**

Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Decoration Description (if present):**

**Cross-Section Shape:** Flat

**Organic Residue Present? (Y= Yes; M= Maybe; N = No):** N

### Comments:

**General Shape:** Oval

**Possible Intended Final Form:** Bead

**General Comments:** Bead that has broken in half? Noted as a fragment in the following sections.

## Artifact: K12-9

Recorder: JMP

Date: 5/3/2016

**Reported Provenience:** Koshkonong Creek Village, 2012 Field Season, Unit 12-01,02,03,04, FF 12-01, Zone H, Heavy Fraction  
>6.33mm

**Morphofunctional Designation:** Fragment

**Length:** 5.14mm

**Width:** 3.13mm

**Thickness:** 3.39mm

**Weight:** 0.1g

### Patina:

**Type A:** Present on 76-100% of object

**Type B:** Not present

**Type C:** Not present

**Location of Patina/Corrosion:** Type A throughout with some Type D. Accretions are thin.

**Type D:** Present on 1-25% of object

**Type E:** Not present

**Accretions:** Present on 76-100% of object

**Pitting:** Present on 1-25% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

End 2: 15.12mm

## Thickness:

Center of body: 7.76mm

End 1: 1.45mm

End 2: 3.15mm

Weight: 67.2g

## Patina:

**Type A:** Present on 26-50% of object

**Type B:** Present on 1-25% of object

**Type C:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type C throughout with Type D in recesses.

**Type D:** Present on 26-50% of object

**Type E:** Not present

**Accretions:** Present on 26-50% of object

**Pitting:** Present on 51-75% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Present

**Cracking:** Present

**Bending:** Present

**Striations:** Not present

**Incisions:** Not present

**Smoothing:**

**Pre-Use:** Present

**Use:** Present

**Incidental:** Present

**Loss:**

**Broken Piece:** Not present

**Nicks:** Present

**Retooling:**

**Reharpener:** Not present

**Repaired:** Not present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Pointed end of adze appears to have been smashed on one side, causing the edge to ripple into a "U" shape. Opposite, flattened end has crack that starts in center of edge and runs longitudinally along center of adze halfway to center of object. Each side of this crack is slightly splayed outward. Surface has many smaller cracks and layers, but this appears to be from fold over hammered manufacturing. Polish on pointed edge and along one side near this edge. Pointed edge also has a few nicks and cracks along edge. Squared edge appears to also have some slight polish and there is a square-shaped, deep impression on its edge that spans the crack. Slight impression running diagonally across adze body near center accompanied with some polish. Following the direction and location of this impression on the opposite side is a line of polish. Probably from hafting?

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Not present

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** N

## Comments:

### Edges:

**Pointed:** Present

**Tapered:** Not present

**Flattened:** Present

**Splayed:** Not present

**Broken:** Not present

### Angle of

**Pointed**

**Edge:**

Greater

than 75

degrees

**General Comments:** Adze-like. Noted in the awl section since that category has the same attributes needing documentation. Slight impression running diagonally across adze body near center accompanied with some polish. Following the direction and location of this impression on the opposite side is a line of polish. Probably from hafting?

## Decoration Description (if present):

**Cross-Section Shape:** Square

## Artifact: S-7

Recorder: JMP Date: 7/3/2016

Reported Provenience: Schmeling, Schmeling Collection

Morphofunctional Designation: Other

### Length:

Maximum: 62.66mm

### Width:

Center of body: 3.22mm

End 1: 0.64mm

End 2: 1.86mm

### Thickness:

Center of body: 3.06mm

End 1: 0.64mm

End 2: 1.86mm

Weight: 11.4g

### Patina:

**Type A:** Present on 76-100% of object

**Type B:** Present on 76-100% of object

**Type C:** Present on 1-25% of object

**Type D:** Present on 51-75% of object

**Type E:** Not present

**Accretions:** Present on 26-50% of object

**Pitting:** Present on 26-50% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Types B and A throughout with Type C in recesses. Polish throughout with coloration of Type E.

### Manufacturing Marks and/or Use-Wear:

#### Stress Damage:

**Mushrooming/Splaying:** Present

**Cracking:** Present

**Bending:** Present

**Striations:** Present

**Incisions:** Present

**Smoothing:**

**Pre-Use:** Present

**Use:** Present

**Incidental:** Not present

**Loss:**

**Broken Piece:** Not present

**Nicks:** Not present

**Retooling:**

**Reharpener:** Present

**Repaired:** Present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Present

**Description of Use-Wear Amount/Location:** Section of tapered edge at very tip is slightly splayed. One of the corners on the flared edge is bent. Dent in center of flared edge with layers of piece separating at this spot. Edges are smoothed with patina from use, except for flared edge which appears to have been ground/sharpened. Surface appears to have been smoothed prior to use or because of use. Crease marks running across object at one point appear to indicate that it may have been bent at one time and then straightened in prehistory or by Mr. Schmeling. Striations/incisions running perpendicular to flared edge. Incised decorations throughout that are in a cross-hatching style. Striations also run along the objects body and mostly run longitudinally.

### Manufacturing Stage/Processes:

**Level of Manufacture:** Finely manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Cut from blank

**Decorations Present:** Present

**Decoration Description (if present):**

**Cross-Section Shape:** Flat

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** Y – white substance caught between layers

### Comments:

#### Edges:

**Pointed:** Not present

**Tapered:** Present

**Flattened:** Not present

**Splayed:** Present

**Broken:** Not present

#### Angle

of

Pointed

Edge:

N/A

**General Comments:** Mace. Noted in the awl section since that category has the same attributes needing documentation. Splayed edge is a flared edge.

**Pitting:** Present on 1-25% of object

**Total Surface Area with**

**Patina/Corrosion:** Present on 76-100% of object

**Location of Patina/Corrosion:** Type C throughout with some areas of Type A. Type D along cracks and recesses.

## Manufacturing Marks and/or Use-Wear:

### Stress Damage:

**Mushrooming/Splaying:** Present

**Cracking:** Present

**Bending:** Not present

**Striations:** Present

**Incisions:** Present

**Smoothing:**

**Pre-Use:** Present

**Use:** Present

**Incidental:** Present

**Loss:**

**Broken Piece:** Not present

**Nicks:** Not present

**Retooling:**

**Reharpener:** Not present

**Repaired:** Not present

**Recent:**

**Cleaned:** Not present

**Reuse:** Not present

**Curation:** Not present

**Description of Use-Wear Amount/Location:** Two incisions running from tip to blunt edge on convex side. Decorations? Possibly formed with a mold. Smoothing along squared edges of sides and blunt edge possibly from manufacture, but more likely from hafting or handling. Indentations on convex/splayed area probably from hammering. Slight smoothing/indentation near tip on one side, perhaps indicating hafting? Tip is intact and smooth. Slight cracking throughout body appears to be evidence of folded over hammering manufacture.

## Manufacturing Stage/Processes:

**Level of Manufacture:** Moderately refined manufactured object

**Possible Manufacturing Method:** Folded over and cold hammered

**Possible Shaping Method:** Hammered

**Decorations Present:** Possibly present

**Decoration Description (if present):** Two incisions running from tip to blunt edge.

**Organic Residue Present? (Y= Yes; M = Maybe; N = No):** N

## Comments:

### Edges:

**Pointed:** Present

**Tapered:** Not present

**Flattened:** Present

**Splayed:** Not present

**Broken:** Not present

**Angle of Pointed Edge:** 0-45 degrees

**General Comments:** Possibly a broken projectile point or an awl with a splayed half for hafting/holding? Fits nicely in between to index fingers and thumb if intended for fine work. Documented as an awl since this is one potential function for this unique artifact.

**Cross-Section Shape:** Triangular
